## Features

- Tolerance to solids in the medium
- Avoids cavitation
- Reduces noise
- Balanced and unbalanced design

**For a given valve size the extension varies according to number of stages while using the same bonnet and body**

Plug guiding in every stage  
(eliminates vibration)

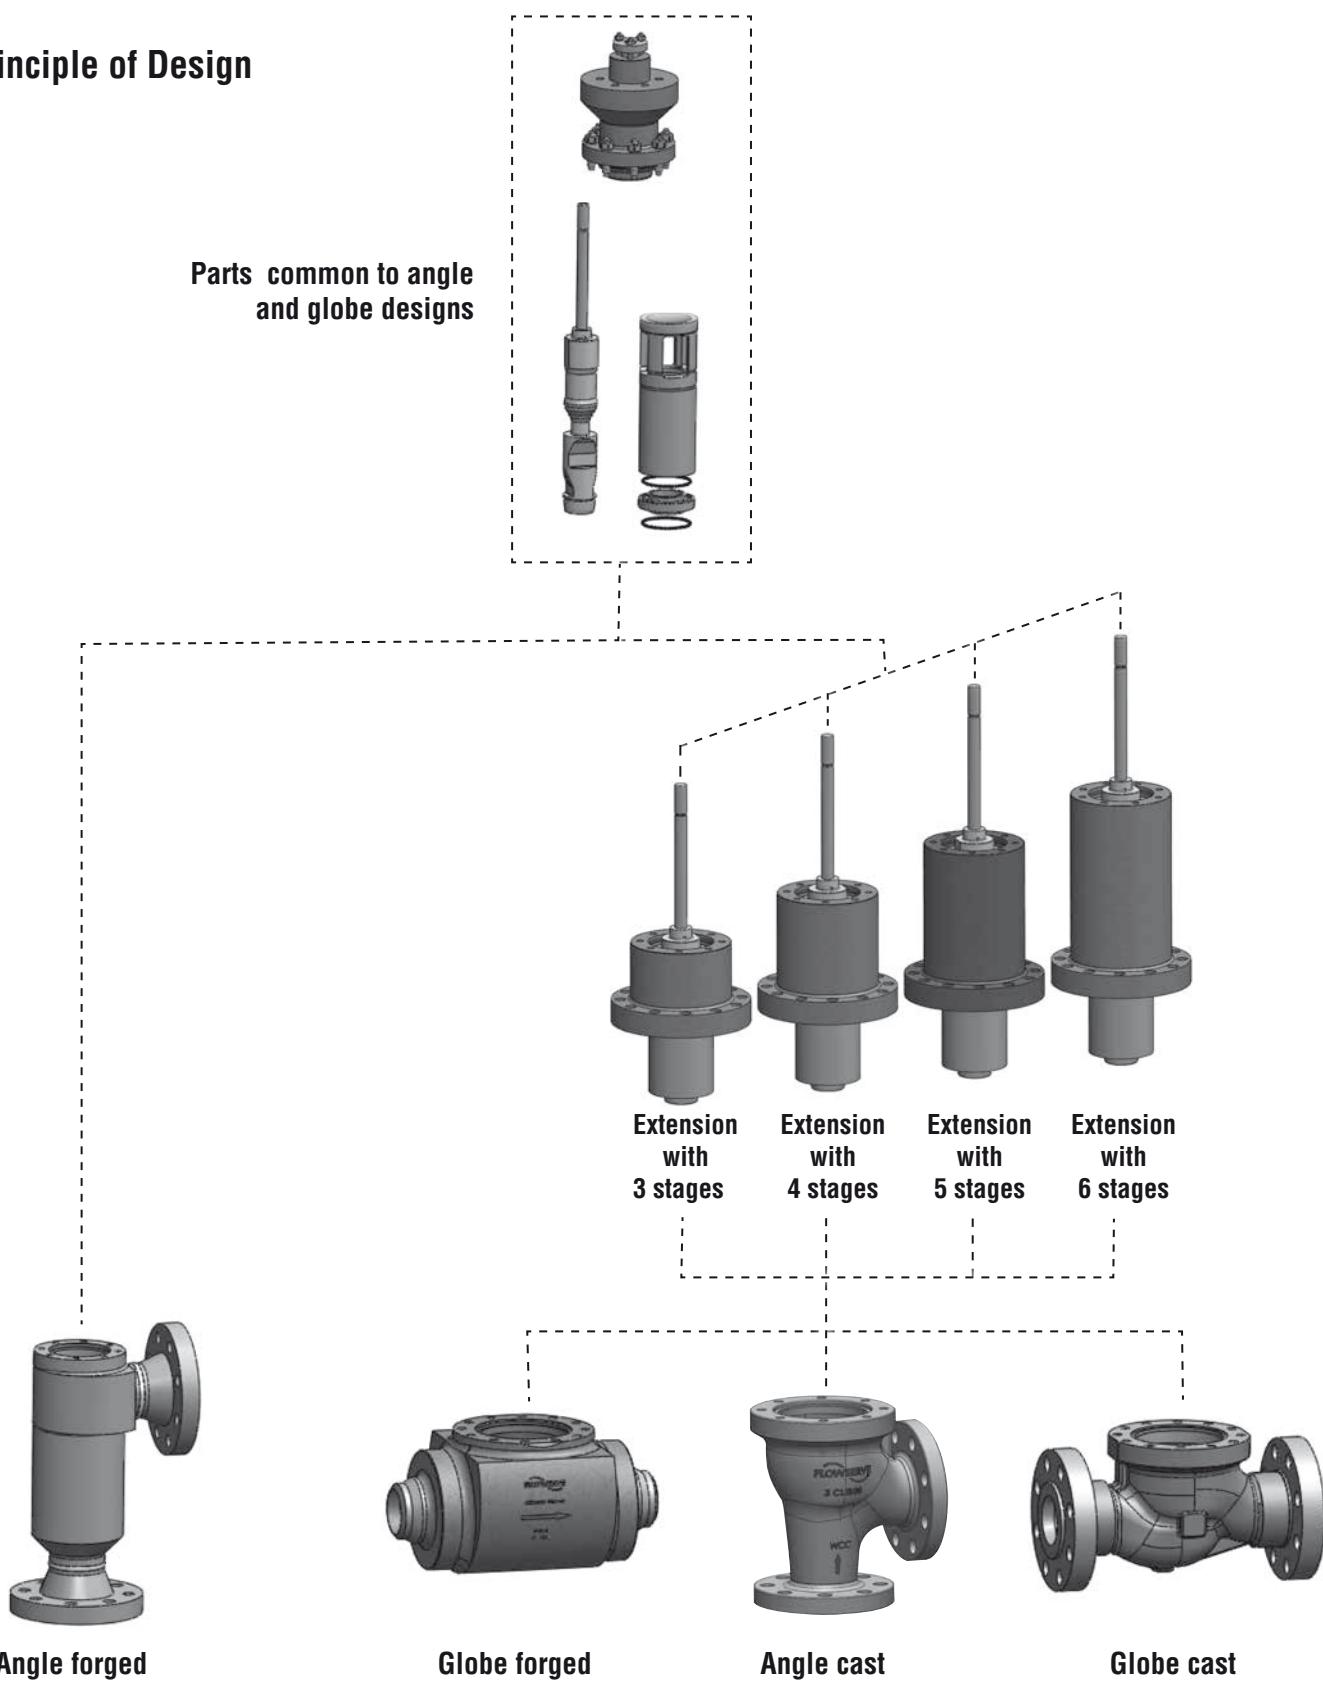

Stages designed with constant  
 $x_F$  / Sigma. Minimizes the damaging  
effects of cavitation

## Specifications

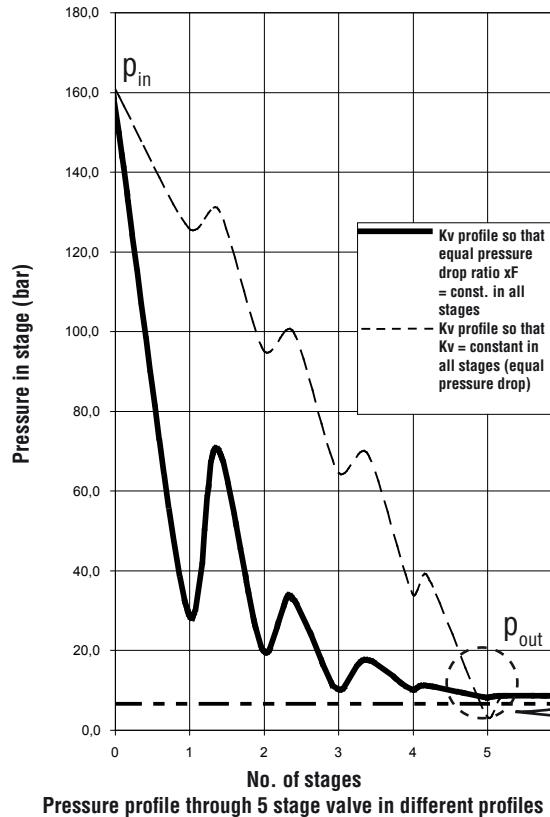

<b>Size</b>	ANSI 1 - 8 inch (globe and angle cast) ANSI 1 - 8 inch and DIN DN 25 - 200 (globe and angle forged) Other sizes upon request
<b>Pressure class</b>	Class 300 - 2500 PN 63-400 Other pressure classes upon request
<b>Body materials</b>	Carbon steel (WCC, A105) Stainless steel (CF8M, 316SS) Other materials upon request
<b>Body type</b>	Angle and globe
<b>End connections</b>	Weld ends Flanges acc. to ANSI and DIN Threaded NPT (up to 2") Different inlet and outlet size Other end connections upon request
<b>Face to face</b>	ANSI / ISA 75.08.01 (CI 300 - 600 globe) ANSI / ISA 75.08.06 (CI 900 - 1500 globe) DIN EN 558 (globe) Flowserve standard for angle forged
<b>Trim type</b>	Balanced or unbalanced Multistage trim 3-6 stages (number of stages as dictated by service conditions) Optional venturi nozzle outlet
<b>Trim designs (see pages 10 to 13)</b>	Standard trim First stage two notches Flow optimized trim First stage On-Off
<b>Trim materials</b>	See table on page 17
<b>Shutoff</b>	ANSI Class IV, V, optional ANSI Class VI
<b>Flow characteristic</b>	Modified Linear, Modified Equal Percentage and custom engineered
<b>Stem Sealing (see page 6)</b>	Standard PTFE, Graphite Fugitive emissions packing according to ISO 15848-1 and TA-Luft Metal bellows seal
<b>Flow capacity and solid size</b>	0.2 to 12.7 mm - see pages 10 to 13 for details
<b>Actuator</b>	Spring diaphragm actuator type KP (stainless steel) Spring diaphragm actuator type FlowAct (carbon steel) Piston actuator type VL / VL-ES Electric actuator Hydraulic actuator

## Principle of Design

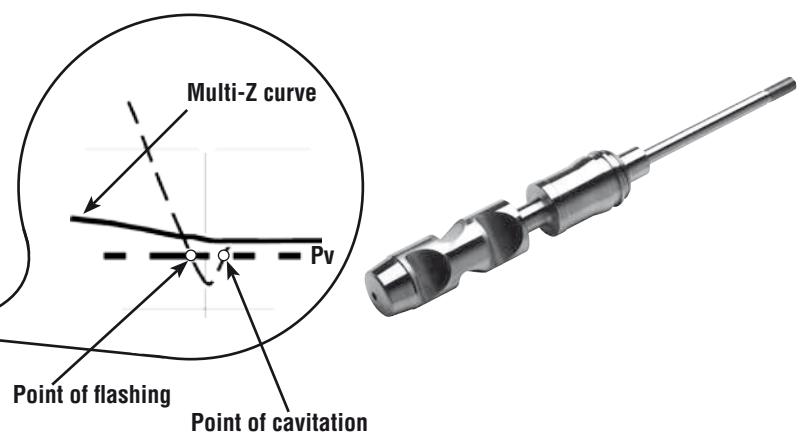

**Globe valve:** for a given valve size an extension with any number of stages can be chosen using the same body and bonnet.  
 (field upgrade possible by changing the extension, plug and liner)

## Principle of cavitation elimination

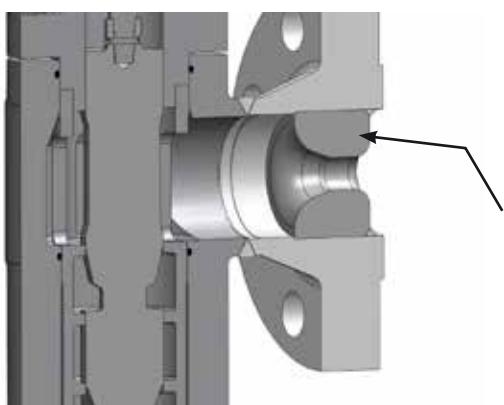

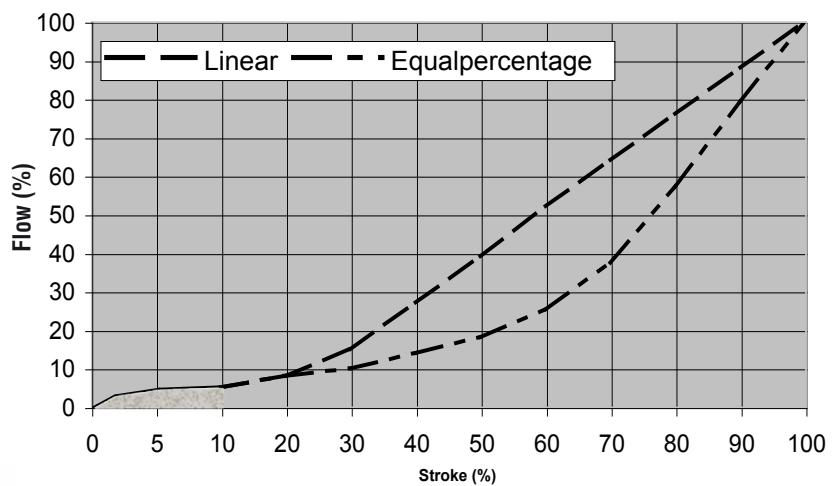

The phenomenon of cavitation occurs when the pressure of the medium drops, for a short time, below the vapor pressure ( $p_v$ ). Behind the vena contracta the pressure recovers and cavitation occurs.

To achieve zero cavitation the Multi-Z trim divides the pressure drop into several parts (3-6, depending on the applications). Every stage is machined to keep the  $x_F$  (respective Sigma) constant. The diagram illustrates the difference between constant  $\Delta p$  (dotted line) and constant  $x_F$  (solid line). The advantage is the last stage where a small  $\Delta p$  does not reach  $p_v$ . Physically the Multi-Z uses the high potential in the first stages to have only a low  $\Delta p$  in the last stage. This method is in accordance with ISA / ASME RP-75.23.

The trim is available with custom flow, modified linear and modified equal percentage characteristics. The first 10% of the stroke provides seat protection to achieve a better control resolution. The Multi-Z utilizes long stroke lengths through complete product range providing greater Cv.

### Venturi outlet nozzle

In flashing applications or where  $p_v$  is greater than  $p_2$  the valve can be fitted with a venturi nozzle integrated into the outlet port. This will ensure that the pressure within the valve is always above the vapor pressure.

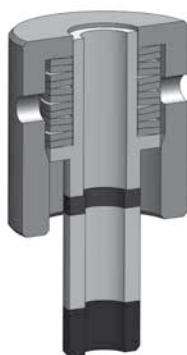

## Industry Applications\*

<b>Refinery</b>	Charge Pump Recirculation Amine Letdown Hot High Pressure Letdown Cold High Pressure Letdown
<b>Oilfield</b>	Produced Water Injection HP Injection Control
<b>Power</b>	Boiler Feedwater Recirculation Boiler Feedwater Startup
<b>All Plants</b>	High Pressure Drop Applications Water Letdown

\* Multi-Z valves are not suitable for oxygen applications

## Packing options

Low emission sealing systems according to ISO 15848-1 and TA-Luft

Compact design  
up to PN 63 / CL 600

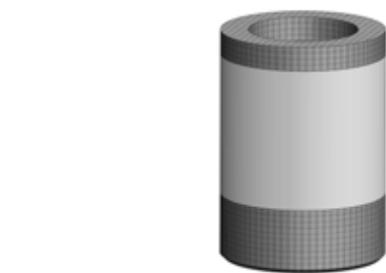

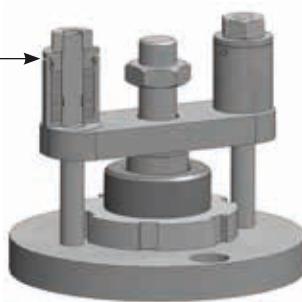

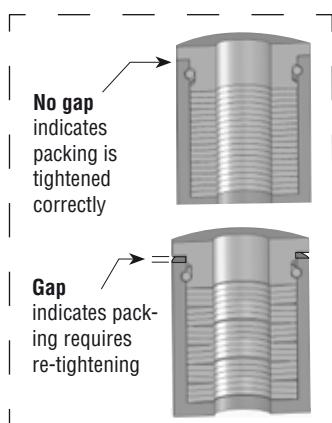

Mixed packing

Standard packing  
PTFE or Graphite

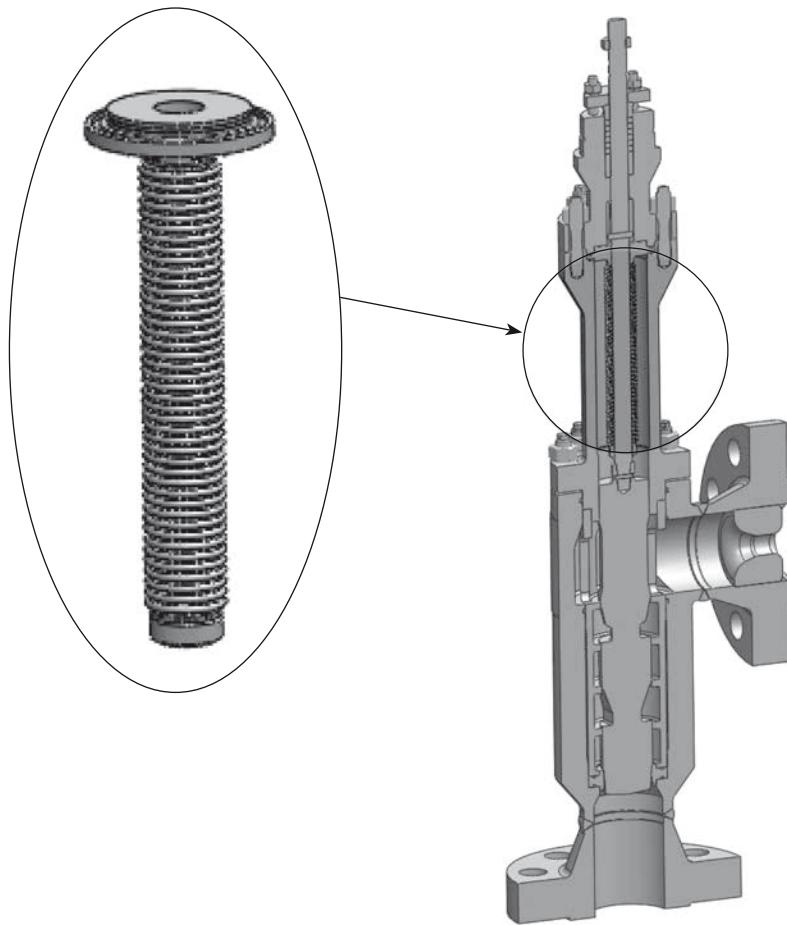

V-Ring packing live loaded

Packing cartridge  
SAS preformed graphite packing with  
metal inlays and ISO certification 15848 B

## Metal bellows seal

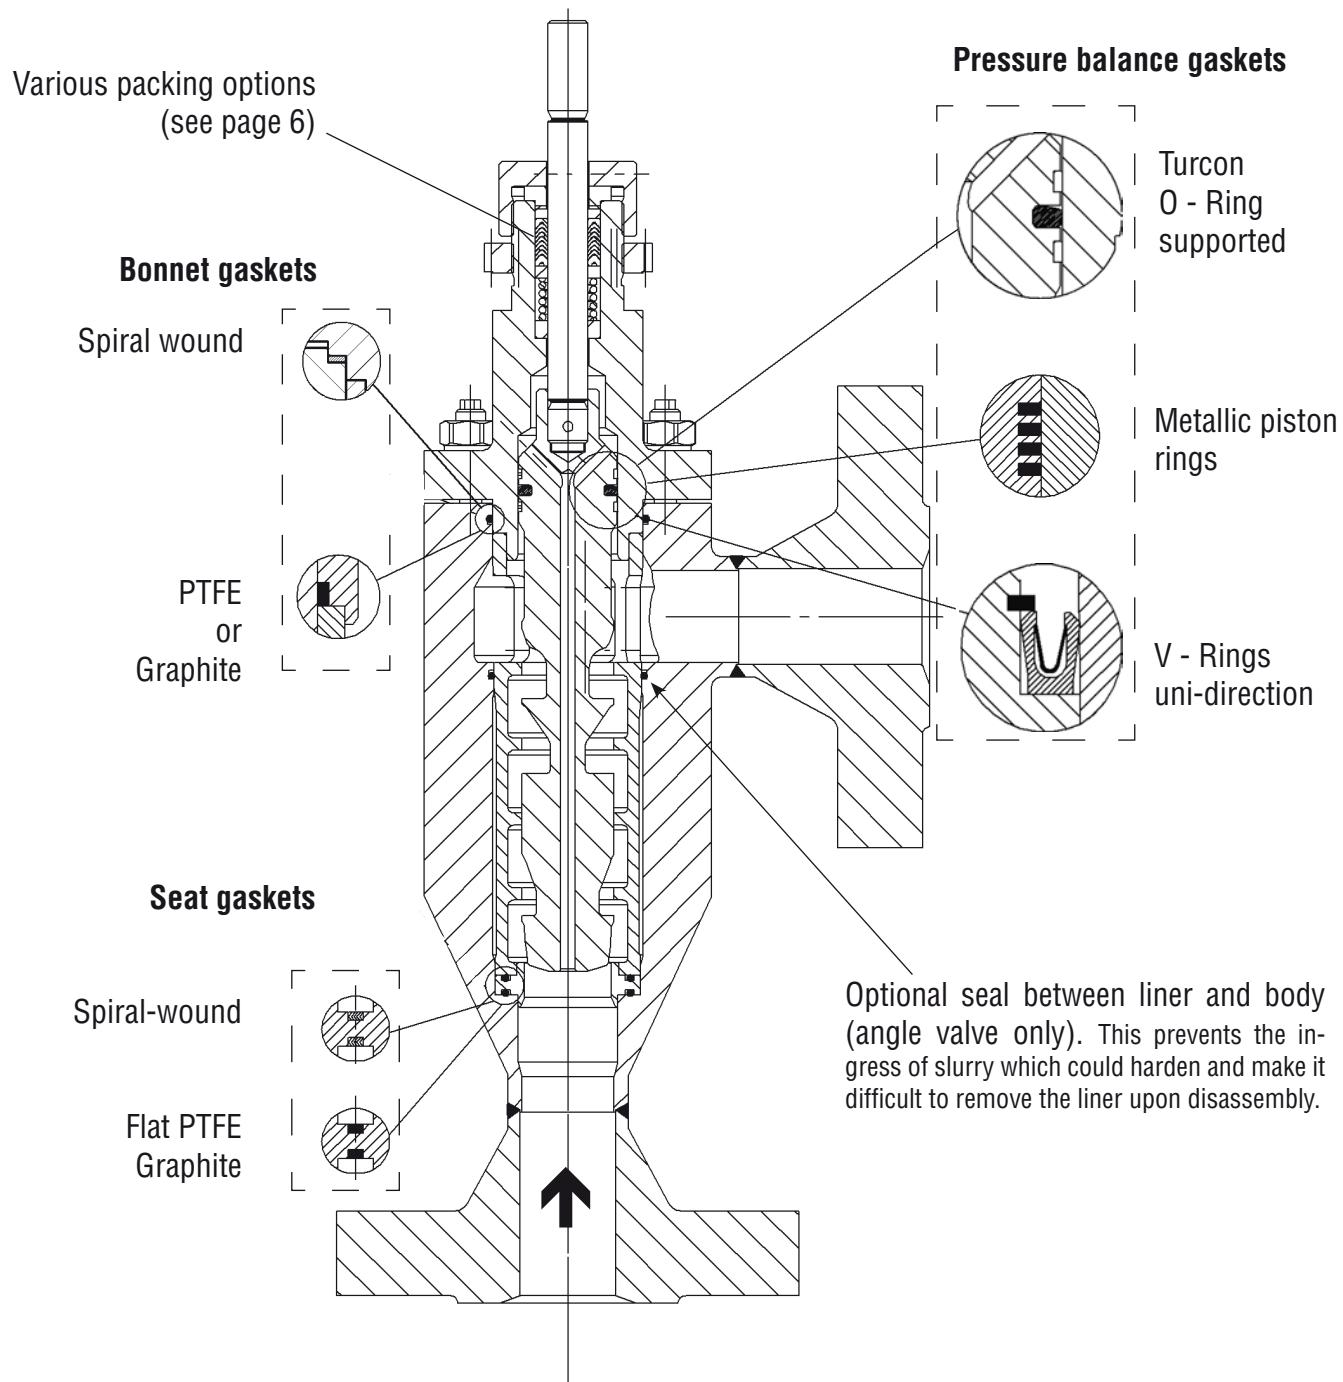

To protect personnel and the environment from toxic or aggressive media, these must be processed in a closed system. Kämmer metal bellows seals fulfill the requirements of the German regulation "TA-Luft". Kämmer's design includes a rugged hydroformed bellows seal with the backup packing seal located well above the bellows. For maximum protection, bellows are provided with up to five walls having wall thickness from 0.1 to 0.15 mm (for greater wall flexibility). A leak detection port is standard.

Kämmer offers a variety of bellows seals, providing the best cycle life in the business. Depending on the pressure and temperature, bellows seal designs can exceed 1 million cycles. To ensure the integrity of the bellows seal, each new valve or bellows seal spare part is tested using a stringent helium leak test.

Instead of a welded bellows design, only hydroformed bellows seals are used because of their strength and ability to withstand pressure, especially in high pressure applications. Because minimal welding is required for hydroformed bellows, they are available in a wide variety of materials, such as 300 series stainless steels, Hastelloy® C 276, Nickel, Monel®, Titanium, Inconel® and PTFE.

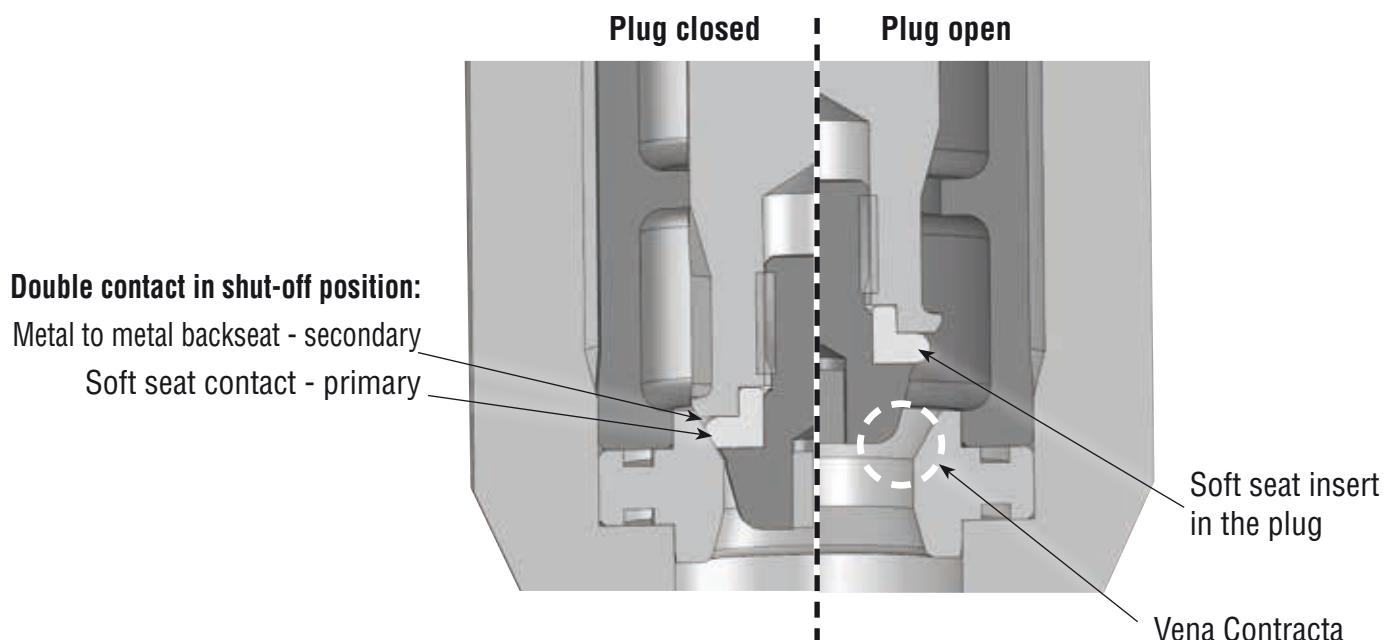

## Sealing options

According to medium and application the Multi-Z offers various sealing options.

## Soft seat

The soft seat parts move away from the Vena Contracta before flow commences to reduce erosion. In the shutoff position there is double contact from soft seat (primary) and metal to metal (secondary).

## Trim Design Standard

### Flow capacity and solid size

The flow capacity is governed by the number of stages. More stages allow a higher pressure drop without cavitation. The AXIAL FLOW MULTI STAGE design provides multiple stages to maximize performance in a given service condition. The calculation is based on the  $x_{F_z}$  resp. Sigma, the indicator for incipient cavitation, used in ISA-RP 75.23.

A very important factor is the maximum solid size. Big solids require larger gaps where best cavitation avoidance requires smaller gaps. For this reason the Multi-Z can be supplied with 4 different trims:

Trim Label	$xF_{MR} (\approx FL^2)$ $\delta_{MR}$	Multi-Z		Cv / Kv

## Trim Design Engineered

- Standard Trim (S):** Optimized for medium with high Delta P and solids.
- First Stage two Notches (N):** For vibrating services the notch design provides additional guiding in the first stage
- First Stage On-Off (O):** For Soft Seat applications and more flow capacity
- Flow Optimized Trim (P):** Optimized for flow capacity and reduced erosion. A reduced xFz (= higher Sigma) per stage gives more flow and larger gaps for solids.

In accordance with ISA / ASME RP-75.23

1) Variable stages (without fix nozzle as last stage)

2) For total pressure drop ratio up to xF total or down to  $\sigma$  total: without cavitation

3) At 100% stroke

4) Maximum Cv is associated to  $\sigma$  total. Please consult Flowserve Essen for higher needed Cv.

In accordance with ISA / ASME RP-75.23

1) Variable stages (without fix nozzle as last stage)

2) For total pressure drop ratio up to xF total or down to  $\sigma$  total: without cavitation

3) At 100% stroke

4) Maximum Cv is associated to  $\sigma$  total. Please consult Flowserve Essen for higher needed Cv.

### Packing (88)

	Material	Max. Pressure	Certificates	Max. Temp
Standard	PTFE	250 bar (3626 psi)	None	250 °C (480 °F)
	Graphite	250 bar (3626 psi)	None	500 °C (930 °F)
Life loaded	Sureguard HP LL	160 bar (2320 psi)	ISO 15848-1 Class B	280 °C (536 °F)
	Sureguard HP 325	325 bar (4713 psi)	TA-Luft (at max. 80 °C)	250 °C (480 °F)
	ISO C V-Ring	100 bar (1450 psi)	ISO 15848-1 Class C	170 °C (338 °F)

### Metal Bellows Seal (6)

	Material	Pressure Class	Max. Temp
Standard	S31635 / 316 Ti / 1.4571	CL600 / 100bar	550 °C (1020 °F)
	N10276 / Hastelloy C276 / 2.4819	325bar	450 °C (840 °F)

### Body temperature limitations

Material	Material group	Min. Temp	Max. Temp
CF8M	2.2	-29 °C (-20 °F)	400 °C (750 °F)
316SS	2.2	-29 °C (-20 °F)	400 °C (750 °F)
WCB/WCC	1.1 / 1.2	-29 °C (-20 °F)	400 °C (750 °F)
A105	1.1	-29 °C (-20 °F)	400 °C (750 °F)

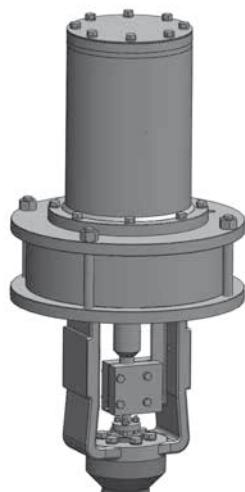

### Pressure balance gasket temperature limitations

	Material	Max. Temp
Standard	Turcon O-Ring supported	250 °C (480 °F)
	Metalic piston rings	400 °C (750 °F)
	V-Ring uni-direction	250 °C (480 °F)

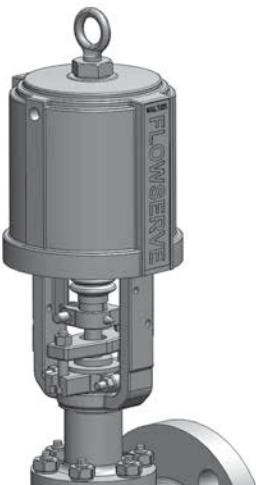

## Actuator mounting options

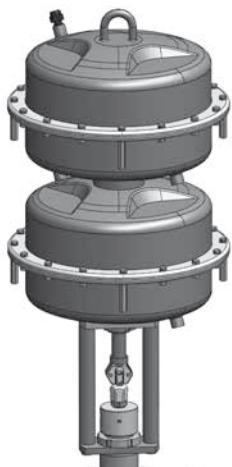

Limitorque, electric

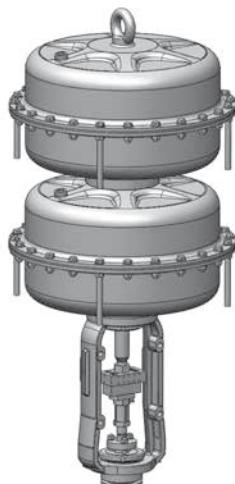

VL-ES, piston

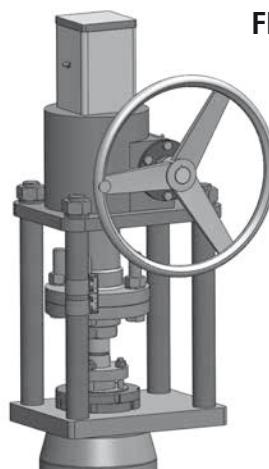

VL, piston

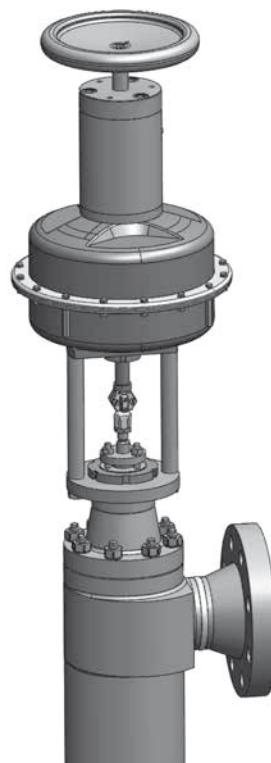

KP, diaphragm

FlowAct, diaphragm

Manual

KP, (diaphragm) with Handwheel
