Actuator mounting options	23

Features

- Tolerance to solids in the medium
- Avoids cavitation
- Reduces noise
- Balanced and unbalanced design

For a given valve size the extension varies according to number of stages while using the same bonnet and body

Plug guiding in every stage (eliminates vibration)

Different actuator mounting options

Various packing options

Multistage plug design for high pressure drop

Same internals for globe and angle valve design

Different plug designs optimized against cavitation or solid size

Metal or soft seat

Clamped seat

Specifications

Size	ANSI 1 - 4 inch (globe cast) ANSI 1 - 8 inch and DIN DN 25 - 200 (globe and angle forged) Other sizes upon request
Pressure class	Class 600 - 1500 PN 63-250 Other pressure classes upon request
Body materials	Carbon steel (WCB, WCC, A105) Stainless steel (CF8M, 316SS) Other materials upon request
Body type	Angle and globe
End connections	Weld ends Flanges acc. to ANSI and DIN Threaded NPT (up to 2") Different inlet and outlet size Other end connections upon request
Face to face	ANSI / ISA 75.08.01 (CI 300 - 600 globe) ANSI / ISA 75.08.06 (CI 900 - 1500 globe) DIN EN 558 (globe) Flowserve standard angle
Trim type	Balanced or unbalanced Multistage trim 3-6 stages (number of stages as dictated by service conditions) Optional venturi nozzle outlet
Trim designs (see pages 10 to 13)	Standard trim First stage two notches Flow optimized trim First stage On-Off
Trim materials	See table on page 17
Shutoff	ANSI Class IV, V, optional ANSI Class VI
Flow characteristic	Modified Linear, Modified Equal Percentage and custom engineered
Stem Sealing (see page 6)	Standard PTFE, Graphite Fugitive emissions packing according to ISO 15848-1 and TA-Luft Metal bellows seal
Flow capacity and solid size	0.2 to 12.7 mm - see pages 10 to 13 for details
Actuator	Spring diaphragm actuator type KP (stainless steel) Spring diaphragm actuator type FlowAct (carbon steel) Piston actuator type VL / VL-ES Electric actuator Hydraulic actuator

Principle of Design

The internal parts and the bonnet are identical for both angle and globe valve designs for any given valve size.

Globe valve: for a given valve size an extension with any number of stages can be chosen using the same body and bonnet. (field upgrade possible by changing the extension, plug and liner)

Principle of cavitation elimination

Pressure profile through 5 stage valve in different profiles

The phenomenon of cavitation occurs when the pressure of the medium drops, for a short time, below the vapor pressure (P_v). Behind the vena contracta the pressure recovers and cavitation occurs.

To achieve zero cavitation the Multi-Z trim divides the pressure drop into several parts (3-6, depending on the applications). Every stage is machined to keep the x_F (respective Sigma) constant. The diagram illustrates the difference between constant ΔP (solid line) and constant x_F (dotted line). The advantage is the last stage where a small Δp does not reach P_v . Physically the Multi-Z uses the high potential in the first stages to have only a low ΔP in the last stage. This method is in accordance with ISA / ASME RP-75.23.

The trim is available with custom flow, modified linear and modified equal percentage characteristics. The first 10% of the stroke provides seat protection to achieve a better control resolution. The Multi-Z utilizes long stroke lengths through complete product range providing greater C_v .

Venturi outlet nozzle

In flashing applications or where P_v is greater than P_2 the valve can be fitted with a venturi nozzle integrated into the outlet port. This will ensure that the pressure within the valve is always above the vapor pressure.

Industry Applications

Refinery	Charge Pump Recirculation
	Amine Letdown
	Hot High Pressure Letdown
	Cold High Pressure Letdown
Oilfield	Produced Water Injection
	HP Injection Control
Power	Boiler Feedwater Recirculation
	Boiler Feedwater Startup
All Plants	High Pressure Drop Applications
	Water Letdown

Packing options

Low emission sealing systems according to ISO 15848-1 and TA-Luft

Compact design
up to PN 63 / CL 600

Mixed packing

V-Ring packing live loaded

Standard packing
PTFE or Graphite

Packing cartridge
SAS preformed graphite packing with
metal inlays and ISO certification 15848 B

Metal bellows seal

To protect personnel and the environment from toxic or aggressive media, these must be processed in a closed system. Kämmer metal bellows seals fulfill the requirements of the German regulation “TA-Luft” Kämmer’s design includes a rugged hydroformed bellows seal with the backup packing seal located well above the bellows. For maximum protection, bellows are provided with up to five walls having wall thickness from 0.1 to 0.15 mm (for greater wall flexibility). A leak detection port is standard.

Kämmer offers a variety of bellows seals, providing the best cycle life in the business. Depending on the pressure and temperature, bellows seal designs can exceed 1 million cycles. To ensure the integrity of the bellows seal, each new valve or bellows seal spare part is tested using a stringent helium leak test.

Instead of a welded bellows design, only hydroformed bellows seals are used because of their strength and ability to withstand pressure, especially in high pressure applications. Because minimal welding is required for hydroformed bellows, they are available in a wide variety of materials, such as 300 series stainless steels, Hastelloy® C 276, Nickel, Monel®, Titanium, Inconel® and PTFE.

Sealing options

According to medium and application the Multi-Z offers various sealing options.

Soft seat

The soft seat parts move away from the Vena Contracta before flow commences to reduce erosion. In the shutoff position there is double contact from soft seat (primary) and metal to metal (secondary).

Flow capacity and solid size

The flow capacity is governed by the number of stages. More stages allow a higher pressure drop without cavitation. The AXIAL FLOW MULTI STAGE design provides multiple stages to maximize performance in a given service condition. The calculation is based on the xFz resp. Sigma, the indicator for incipient cavitation, used in ISA-RP 75.23.

A very important factor is the maximum solid size. Big solids require larger gaps where best cavitation avoidance requires smaller gaps. For this reason the Multi-Z can be supplied with 4 different trims:

Standard Trim

In accordance with ISA / ASME RP-75.23

1) Variable stages (without fix nozzle as last stage)

2) For total pressure drop ratio up to xF total or down to σ total: without cavitation

3) At 100% stroke

4) Maximum Cv is associated to σ total. Please consult Flowserve Essen for higher needed Cv.

- Standard Trim:** Optimized for medium with high Delta P and solids.
- First Stage two Notches:** For vibrating services the notch design provides additional guiding in the first stage
- Flow Optimized Trim:** Optimized for flow capacity and reduced erosion. A reduced xFz (= higher Sigma) per stage gives more flow and larger gaps for solids.
- First Stage On-Off:** For Soft Seat applications and more flow capacity

First Stage two Notches

In accordance with ISA / ASME RP-75.23

1) Variable stages (without fix nozzle as last stage)

2) For total pressure drop ratio up to xF total or down to σ total: without cavitation

3) At 100% stroke

4) Maximum Cv is associated to σ total. Please consult Flowserve Essen for higher needed Cv.
