

Series WK 70/74
Low Ferrite Tube Bore Clean Valves

Experience In Motion

Flowserve Worcester Controls' Series WK 70 forged clean valves and WK 74 cast clean valves operate dependably in the pharmaceutical, biotech, food, cosmetic, paint, chemical and semi-conductor manufacturing industries where microbes, media deposits, mineral impurities and cross-contamination can threaten the quality of the product. The high-purity design, high vacuum rating, high cycle life and pressure/temperature rating of these valves makes them ideal for applications from sterile steam to nutrient inlets to high-purity water. The performance of these tube bore clean valves is based on a combination of high standard specifications.

WK 70 Forged-Tube Bore and WK 74 Cast-Tube Bore

A clean valve to write your specifications around:

Bore, metallurgy, surface finish, shut-off, automation and ease of cleaning

● Tube Bore

The inside diameter of the valve components are tube bore dimensions so that the valve precisely matches the tubing it is connected to. This prevents buildup of pyrogens or bacteria.

● Forged Valve

WK 70 valves are built of forged parts. From an integrity perspective, forgings are better than castings for clean service because they are stronger, free from crevices, pits, shrinks or inclusions and have better controlled metallurgy.

● Low Ferrite Content

WK 70 valves are made of 316L stainless steel and have a guaranteed ferrite content of less than 1%. The WK 74 is cast from CF3M (316L) and has a guaranteed ferrite content of less than 5%. This prevents rouging resulting from minerals and impurities drawn from higher ferrite content metals.

● High Integrity Welds

The metallurgy of the body and extended tube ends assures the integrity of the orbital welding. The tube ends have a verifiable sulphur content between .005 percent and .016 percent. Too much sulphur causes a lack of penetration of the orbital welding. With a low sulphur content comparable to that of the process tubing, the quality of the weld is assured.

● CMTRs

Certified Material Test Reports are available for the body, pipe ends, ball and stem (request when placing order).

● High-Cycle Sealing, Bubble-Tight Shutoff

Seats of PTFE, Reinforced PTFE or Fluorofill provide bubble-tight shutoff through the valve, even under conditions of high vacuum and high cycle operation. High-cycle stem seals assure external sealing when the valve is automated.

● Steam Service Capability

Fluorofill is a PTFE material with carbon and graphite fillers with excellent high temperature properties. These standard seats are capable of up to 20 barg working steam pressure (WSP) making the WK 70 valve ideal for sterile steam applications.

● 3"- 4" Series WK 70 Clean Valves

Worcester's clean valves are optionally available in 3" and 4" sizes with quick disconnecting Hygienic Clamps and XBO (Automatic Tube Butt weld) ends.

● Purge Ports

Purge ports are available for CIP (Clean in Place) & SIP (Sterilise in Place) applications.

N.B. 3" and 4" valves available as WK74 cast tube bore only, dimensional details upon request.

Applications

Microelectronics Manufacturing

- High vacuum
- High-purity gases
- Toxic gases
- Solvent lines
- Instrumentation tie-ins

Pharmaceutical/Biotech

- High-purity water
- Sterile steam
- Flush-bottom tank valves
- Cleaning: acids, caustic, deionised water
- Gas and air sparging
- Media and nutrients inlets

Sterile steam/Distillation

- Sterile steam
- Distilled water
- Recirculation loops

Cosmetics and Creams

- Oils
- Shampoos, detergents
- White wax

Lyophilisation (Freeze-Drying)

- High vacuum
- Cryogenic liquids
- Super-cooled oils
- Sterile steam
- High-purity inert gases

Food Processing

- Wine and spirits
- Hot cooking oils
- Steam
- Water feed lines
- Retort lines

Environment Control

Worcester Controls assembles all clean service and cryogenic valves in a Class 100 work area.

Testing and Inspections

U.V Light Test

All wetted components are U.V. light inspected to confirm that all surfaces are free of fluorescent oils or greases.

Wipe Test

All wetted components are then wipe tested using Whatman #44 paper, to ensure all surfaces are free of grit, dirt and contamination.

Helium Leak Test

Once assembled, all valves are pressurised internally with 80 psi of helium. They are then mass spectrometer tested for both through and external leaks. No leakage is permitted.

Vacuum Sealed

After all testing has been completed, clean valves are double vacuum-sealed in 4 mil plastic bags that are nested one inside the other. This ensures product integrity up to the point of delivery.

Surface Finish Measurements

RMS (microinch)	RMS (micron)	Ra (micrometre)	Grit Size
160	4.06	3.50	36
98	2.49	2.18	60
80	2.03	1.78	80
58	1.47	1.30	120
34	.86	0.75	180
17	.43	0.38	240
14	.36	0.30	320

Valves For Stick-Free Operation on Rubber Polymers, Monomers, Styrene, Butadiene, Slurries

Cavity Filler

Worcester Controls offers the quality solution to sticking valve problems - cavity-filled ball valves. Some of the roughest process control problems involve those in butadiene and styrene services. These and other fluids such as rubber polymers can polymerize in place. That means they can polymerise inside valve body cavities, effectively immobilising the valves.

In applications where product can polymerize, FEP seats are available to reduce "blooming" which can occur in PTFE or reinforced PTFE seats.

A unique seat design using PTFE, Fluorofill or FEP eliminates most of the volume between the ball, stem and body. This reduces area for product build-up associated with conventional ball valves.

Fire Safety

Worcester Controls offers a fire-rated version of the cavity-filled valve. FEP cavity filled seats are qualified per API 607(4th Edition). Grafoil stem seals and body seals (suitable for butadiene processes) are used on fire-rated valves.

Automation

Cavity-filled valves may be completely automated with Norbro 40R series pneumatic or 75 series electric actuators. Both actuators can be optionally equipped with process monitoring equipment and/or positioners for modulating applications. Special automation packages are available for PLC/computer-controlled systems.

The Autamax SXL Series utilises a 316 series stainless steel body and is ideal for use in corrosive environments. It is available in both Double Acting and Spring Return versions with a maximum double acting torque output of 822.4Nm. The SX Series can be supplied with stainless steel or aluminium pistons and springs per customer requirements and is also available with optional polished finishes for sanitary applications.

Applications:

- Styrene
- Monomers
- Butadiene
- Detergent Slurry
- Fermentation Process
- Food Process
- Pharmaceuticals
- Fire-Safe Applications

Seat Pressure / Temperature Ratings for WK70 and WK 74

NOTE:

Stainless steel valves are CE Marked in accordance with the Pressure Equipment Directive 97/23/EC, conformity assessment Module H and are classified in Category III (not end of line duty).

Carbon steel valves are classified as SEP (Sound Engineering Practice) and, in accordance with the Pressure Equipment Directive, are not CE Marked. These valves may be used within the limitations defined in Annex II of the Directive.

End Connections WK70 & WK74

Standard end connections for tubing are quick disconnecting Hygienic Clamps and Extended Butt Weld (XBO Automatic Tube Butt weld) ends for use with orbital welders. Service pressure ratings of Quick Disconnect ends vary according to the type of clamp fittings and gaskets used (consult Flowserve). XBO ends are rated to 800 psi with one-piece seats, and 1500 psi if using separate seats and seals. Valves with end connections compatible with compression fittings are available - please contact Flowserve.
