1 Overview

1.1 Multi 3510 IDS meter

The compact, digital precision meter Multi 3510 IDS enables you to carry out pH measurements, ORP measurements, conductivity measurements and dissolved oxygen (D.O.) measurements quickly and reliably.

The Multi 3510 IDS provides the maximum degree of operating comfort, reliability and measuring certainty for all applications.

The Multi 3510 IDS supports you in your work with the following functions:
- Automatic sensor recognition
- CMC (continuous measurement control)
- QSC (sensor quality control)
- Electronic access control
- Data transmission via the USB interface (USB-B).

1.2 Sensors

A measuring system ready to measure consists of the Multi 3510 IDS meter and a suitable sensor.

Suitable sensors are IDS pH sensors, IDS ORP sensors, IDS conductivity sensors and IDS D.O. sensors.
1.2.1 IDS sensors

IDS sensors

- support the automatic sensor recognition
- show only the settings relevant to the specific sensor in the setting menu
- process signals in the sensor digitally so that precise and interference-free measurements are enabled even with long cables
- facilitate to assign a sensor to a measured parameter with differently colored couplings
- have quick-lock couplings with which to fix the sensors to the meter.

Sensor data from IDS sensors

IDS sensors transmit the following sensor data to the meter:

- SENSOR ID
  - Sensor name
  - Sensor series number
- Calibration data
- Measurement settings

The calibration data are updated in the IDS sensor after each calibration procedure. A message is displayed while the data are being updated in the sensor.

In the measured value display, you can display the sensor name and series number of the selected sensor with the [Info] softkey. You can then display further sensor data stored in the sensor with the [More] softkey (see section 4.1.5 SENSOR INFO, page 17).
1.2.2 IDS adapter for analog sensors

With the aid of an IDS adapter, you can also operate analog sensors on the Multi 3510 IDS. The combination of the IDS adapter and analog sensor behaves like an IDS sensor. The measuring electronics with the stored adapter data are in the adapter head. The adapter data correspond to the sensor data.

Information on available IDS adapters is given on the Internet and in the WTW catalog, "Laboratory and field instrumentation". Detailed information on the IDS adapter is given in the operating manual of the adapter.

1.2.3 Automatic sensor recognition

The automatic sensor recognition for IDS sensors allows

- to operate an IDS sensor with different meters without recalibrating
- to assign measurement data to an IDS sensor
  - Measurement datasets are always stored and output with the sensor name and sensor series number.
- to assign calibration data to an IDS sensor
  - Calibration data and calibration history are always stored and output with the sensor name and sensor series number.
- to hide menus automatically that do not concern this sensor

To be able to use the automatic sensor recognition, a meter that supports the automatic sensor recognition (e.g. Multi 3510 IDS) and a digital IDS sensor are required.

In digital IDS sensors, sensor data are stored that clearly identify the sensor. The sensor data are automatically taken over by the meter.
2 Safety

2.1 Safety information

2.1.1 Safety information in the operating manual

This operating manual provides important information on the safe operation of the meter. Read this operating manual thoroughly and make yourself familiar with the meter before putting it into operation or working with it. The operating manual must be kept in the vicinity of the meter so you can always find the information you need.

Important safety instructions are highlighted in this operating manual. They are indicated by the warning symbol (triangle) in the left column. The signal word (e.g. "Caution") indicates the level of danger:

WARNING
- Indicates a possibly dangerous situation that can lead to serious (irreversible) injury or death if the safety instruction is not followed.

CAUTION
- Indicates a possibly dangerous situation that can lead to slight (reversible) injury if the safety instruction is not followed.

NOTE
- Indicates a possibly dangerous situation where goods might be damaged if the actions mentioned are not taken.

2.1.2 Safety signs on the meter

Note all labels, information signs and safety symbols on the meter and in the battery compartment. A warning symbol (triangle) without text refers to safety information in this operating manual.

2.1.3 Further documents providing safety information

The following documents provide additional information, which you should observe for your safety when working with the measuring system:

- Operating manuals of sensors and other accessories
- Safety datasheets of calibration or maintenance accessories (such as buffer solutions, electrolyte solutions, etc.)
2.2 Safe operation

2.2.1 Authorized use

The authorized use of the meter consists exclusively of the measurement of the pH, ORP, conductivity and dissolved oxygen in a laboratory environment.

Only the operation and running of the meter according to the instructions and technical specifications given in this operating manual is authorized (see section 14 TECHNICAL DATA, page 87).

Any other use is considered unauthorized.

2.2.2 Requirements for safe operation

Note the following points for safe operation:

• The meter may only be operated according to the authorized use specified above.
• The meter may only be supplied with power by the energy sources mentioned in this operating manual.
• The meter may only be operated under the environmental conditions mentioned in this operating manual.
• The meter may only be opened if this is explicitly described in this operating manual (example: Inserting the batteries).

2.2.3 Unauthorized use

The meter must not be put into operation if:

• it is visibly damaged (e.g. after being transported)
• it was stored under adverse conditions for a lengthy period of time (storing conditions, see section 14 TECHNICAL DATA, page 87).
3 Commissioning

3.1 Scope of delivery

- Meter Multi 3510 IDS
- 4 batteries 1.5 V Mignon type AA
- Short instructions
- CD-ROM with
  - USB drivers
  - comprehensive operating manual (4 languages)
  - software MultiLab User
  - software MultiLab Importer

3.2 Power supply

The Multi 3510 IDS is supplied with power in the following ways:

- Battery operation (4 batteries, 1.5 V Mignon type AA)
- USB operation via a connected USB-B cable

3.3 Initial commissioning

Perform the following activities:

- Insert the supplied batteries
- Switch on the meter (see section 4.2 SWITCHING ON THE METER, page 18)
- Set the date and time (see section 4.5.5 EXAMPLE 2 ON NAVIGATION: SETTING THE DATE AND TIME, page 24)
3.3.1 Inserting the batteries

You can operate the meter either with normal batteries or with rechargeable batteries (Ni-MH). In order to charge the batteries, an external charging device is required.

1. Unscrew the two screws (1) on the underside of the meter.
2. Open the battery compartment (2) on the underside of the meter.

**CAUTION**

Make sure that the poles of the batteries are positioned correctly. The ± signs on the batteries must correspond to the ± signs in the battery compartment.

3. Place four batteries (type Mignon AA) in the battery compartment.
4. Close the battery compartment (2).
5. Set the date and time (see section 4.5.5 EXAMPLE 2 ON NAVIGATION: SETTING THE DATE AND TIME, page 24).
## 4 Operation

### 4.1 General operating principles

#### 4.1.1 Keypad

In this operating manual, keys are indicated by brackets `<..<>`. The key symbol (e.g. `<ENTER>`) generally indicates a short keystroke (press and release) in this operating manual. A long keystroke (press and hold for approx. 2 sec) is indicated by the underscore behind the key symbol (e.g. `<ENTER_>`).

<table>

4.1.2 Display

Example (pH):

1 Status information (sensor)
2 Measured value
3 Measured parameter
4 Continuous measurement control (CMC function)
5 Sensor symbol (calibration evaluation, calibration interval)
6 Measured temperature (with unit)
7 Status information (meter)
8 Softkeys and date + time

4.1.3 Status information (meter)

<table>
<thead>
<tr>
<th>AR</th>
<th>Stability control (AutoRead) is active</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOLD</td>
<td>Measured value is frozen (&lt;AR&gt; key)</td>
</tr>
<tr>
<td></td>
<td>Batteries are almost empty</td>
</tr>
<tr>
<td>USB</td>
<td>Data are automatically output to the USB-B interface at intervals</td>
</tr>
</tbody>
</table>
4.1.4 Instrument connectors

You can display the current sensor data and sensor settings of a connected sensor at any time. The sensor data are available in the measured value display with the \[<F1>/\text{Info}\] softkey.

1 IDS sensors: (pH, ORP, conductivity, D.O.)
2 USB B (device) interface
3 Service interface

**CAUTION**

Only connect sensors to the meter that cannot return any voltages or currents that are not allowed (> SELV and > current circuit with current limiting).

WTW IDS sensors and IDS adapters meet these requirements.

4.1.5 Sensor info

You can display the current sensor data and sensor settings of a connected sensor at any time. The sensor data are available in the measured value display with the \[<F1>/\text{Info}\] softkey.

1. In the measured value display:
   Display the sensor data (sensor name, series number) with \[<F1>/\text{Info}\].
2. Display further sensor data (settings) with <F1>/[More].

4.2 Switching on the meter

1. Switch the meter on with <On/Off>. The meter performs a self-test.
2. Connect the sensor. The meter is ready to measure.

If the user administration function is activated, the Login dialog appears after the meter is switched on (see section 4.4 LOGIN WITH A USER NAME, page 19).

The user administration function is not active in the delivery condition.
4.3 Switching off the meter

1. Switch the meter off with <On/Off>.

4.4 Login with a user name

After activation of the user administration by the administrator (software MultiLab User, on the enclosed CD-ROM), measurements are only possible after login with a user name. The user name is documented with the measured values and in records.

All user names entered by the administrator are listed in the User name menu. The administrator determines for each user whether or not a password is required for the login to the meter.

If the Password menu item is grayed out, no password is required for the login.

1. Switch the meter on with <On/Off>. The Login dialog appears.

2. Using <▲><▼>, select the menu item, User name and confirm with <ENTER>. The user name is highlighted.

3. Using <▲><▼>, select a user name and confirm with <ENTER>.

The login is done immediately if no password is required. If a sensor is connected the measured value display appears.

4. If a password is required:
   Using <▲><▼>, select the menu item, Password and confirm with <ENTER>.
The user specifies the password when he or she first logs in with a user name.
A valid password consists of 4 digits.
The user can change the password with the next login.

5. Change the digit of the highlighted position with $<\Delta><\nabla>$. Go to the next digit of the password with $<F2>/[\uparrow]$. When the password was completely entered, confirm with $<\text{ENTER}>$. The login takes place. If a sensor is connected the measured value display appears.

### Changing the password

If the administrator has set up the access with password protection:

1. Switch the meter on with $<\text{On/Off}>$. The Login dialog appears.

2. Using $<\Delta><\nabla>$, select the menu item, User name and confirm with $<\text{ENTER}>$. The user name is highlighted.

3. Using $<\Delta><\nabla>$, select a user name and confirm with $<\text{ENTER}>$.

4. Using $<\Delta><\nabla>$, select the menu item, Change password and confirm with $<\text{ENTER}>$.

5. In the Password field, enter the old password with $<\Delta><\nabla>$ and $<F2>/[\uparrow]$ and confirm it with $<\text{ENTER}>$.

6. In the New password field, enter the new password with $<\Delta><\nabla>$ and $<F2>/[\uparrow]$ and confirm it with $<\text{ENTER}>$. The password is changed.
The login takes place. If a sensor is connected the measured value display appears.

### Forgotten the password?

Contact the administrator.

### 4.5 Navigation

#### 4.5.1 Operating modes

<table>
<thead>
<tr>
<th>Operating mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Measuring</td>
<td>The measurement data of the connected sensor are shown in the measured value display</td>
</tr>
<tr>
<td>Calibration</td>
<td>The course of a calibration with calibration information, functions and settings is displayed</td>
</tr>
<tr>
<td>Storing in memory</td>
<td>The meter stores measuring data automatically or manually</td>
</tr>
</tbody>
</table>
4.5.2 Measured value display

In the measured value display, you can

- open the menu for calibration and measurement settings with <ENTER> (short keystroke)
- open the Storage & config system menu with the sensor-independent settings by pressing <ENTER> (long keystroke, approx. 2 s).
- change the display in the selected measuring screen (e.g. pH >– mV) by pressing <M>.

4.5.3 Menus and dialogs

The menus for settings and dialogs in procedures contain further subelements. The selection is made with the < ▲ > < ▼ > keys. The current selection is displayed with a frame.

- **Submenus**
  The name of the submenu is displayed at the upper edge of the frame. Submenus are opened by confirming with <ENTER>. Example:

<table>
<thead>
<tr>
<th>System</th>
<th>General</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Clock function</td>
</tr>
<tr>
<td>Service information</td>
<td>Reset</td>
</tr>
</tbody>
</table>

- **Settings**
  Settings are indicated by a colon. The current setting is displayed on the right-hand side. The setting mode is opened with <ENTER>. Subsequently, the setting can be changed with < ▲ > < ▼ > and <ENTER>. Example:
Functions
Functions are designated by the name of the function. They are immediately carried out by confirming with <ENTER>. Example: Display the Calibration record function.

Messages
Information is marked by the [i] symbol. It cannot be selected. Example:
4.5.4 Example 1 on navigation: Setting the language

1. Press the <On/Off> key.
   The measured value display appears.
   The instrument is in the measuring mode.

2. Using <ENTER>, open the Storage & config menu.
   The instrument is in the setting mode.

3. Select the System submenu with <▲><▼>.
   The current selection is displayed with a frame.

4. Open the System submenu with <ENTER>.
5. Select the General submenu with <▲><▼>. The current selection is displayed with a frame.

6. Open the General submenu with <ENTER>.

7. Open the setting mode for the Language with <ENTER>.

8. Select the required language with <▲><▼>.

9. Confirm the setting with <ENTER>. The meter switches to the measuring mode. The selected language is active.

4.5.5 Example 2 on navigation: Setting the date and time

The meter has a clock with a date function. The date and time are indicated in the status line of the measured value display. When storing measured values and calibrating, the current date and time are automatically stored as well.

The correct setting of the date and time and date format is important for the following functions and displays:

- Current date and time
- Calibration date
- Identification of stored measured values.
Therefore, check the time at regular intervals.

After a fall of the supply voltage (empty batteries), the date and time are reset.

**Setting the date, time and date format**

The date format can be switched from the display of day, month, year\((dd.mm.yy)\) to the display of month, day, year\((mm/dd/yy\) or \(mm.dd.yy\)).

1. In the measured value display:
   - Using **<ENTER>_**, open the *Storage & config* menu.
   - The instrument is in the setting mode.
2. Select and confirm the *System / Clock function* menu with **<▲><▼>** and **<ENTER>**.
   - The setting menu for the date and time opens up.

   ![Clock function menu](image)

3. Select and confirm the *Time* menu with **<▲><▼>** and **<ENTER>**.
   - The hours are highlighted.
4. Change and confirm the setting with **<▲><▼>** and **<ENTER>**.
   - The minutes are highlighted.
5. Change and confirm the setting with **<▲><▼>** and **<ENTER>**.
   - The seconds are highlighted.
6. Change and confirm the setting with **<▲><▼>** and **<ENTER>**.
   - The time is set.
7. If necessary, set the *Date and Date format*. The setting is made similarly to that of the time.
8. To make further settings, switch to the next higher menu level with **<F1>/ [Back]**.
   - or
   - Switch to the measured value display with **<M>**.
   - The instrument is in the measuring mode.
5 pH value

5.1 Measuring

5.1.1 Measuring the pH value

*NOTE*
When connecting a grounded PC/printer, measurements cannot be performed in grounded media as the values would be incorrect. The USB interface is not galvanically isolated.

1. Connect the IDS pH sensor to the meter. The pH measuring window is displayed.
2. If necessary, select the measured parameter with <M>.
3. Adjust the temperature of the solutions and measure the current temperature if the measurement is made without a temperature sensor.
4. If necessary, calibrate or check the IDS pH sensor.
5. Immerse the IDS pH sensor in the test sample.

The measured parameter flashes on the display

- as soon as the measured value is outside the stability range
- when the automatic *Stability control* is switched off.

You can start the *Stability control* manually at any time, irrespective of the setting for automatic *Stability control* (see section 9.5.3 AUTOMATIC STABILITY CONTROL, page 69) in the *System* menu.

1. Freeze the measured value with <AR>. The [HOLD] status indicator is displayed. The HOLD function is active.

Stability control
(AutoRead) & HOLD function
The stability control function (*AutoRead*) continually checks the stability of the measurement signal. The stability has a considerable impact on the reproducibility of measured values.
You can terminate the Stability control function and the HOLD function with <AR> or <M> at any time.

2. Using <ENTER>, activate the Stability control function manually. The [AR] status indicator appears while the measured value is assessed as not stable. A progress bar is displayed and the display of the measured parameter flashes. The [HOLD][AR] status indicator appears as soon as a stable measured value is recognized. The progress bar disappears and the display of the measured parameter stops flashing. The current measurement data is output to the interface. Measurement data meeting the stability control criterion is marked by AR.

You can prematurely terminate the Stability control function manually with <ENTER> at any time. If the Stability control function is prematurely terminated, the current measurement data are output to the interface without the AutoRead info.

3. Using <ENTER>, start a further measurement with stability control. or Release the frozen measured value again with <AR> or <M>. The [AR] status display disappears. The display switches back to the previous indication.

### Criteria for a stable measured value

The Stability control function checks whether the measured values are stable within the monitored time interval.

The minimum duration until a measured value is assessed as stable is the monitored time interval. The actual duration is mostly longer.

### 5.1.2 Measuring the temperature

For reproducible pH measurements, it is essential to measure the temperature of the test sample.

IDS sensors measure the temperature with a temperature sensor integrated in the IDS sensor.

When operating a sensor without integrated temperature sensor, e.g. via an IDS pH adapter, you have to measure and enter the temperature of the test sample first.

The display of the temperature indicates the active temperature measuring
5.2 pH calibration

5.2.1 Why calibrate?

pH electrodes age. This changes the zero point (asymmetry) and slope of the pH electrode. As a result, an inexact measured value is displayed. Calibration determines and stores the current values of the zero point and slope of the electrode. Thus, you should calibrate at regular intervals.

5.2.2 When do you have to calibrate?

- Routinely within the framework of the company quality assurance
- When the calibration interval has expired

5.2.3 Carrying out automatic calibration (AutoCal)

Make sure that in the sensor menu, Buffer menu, the buffer set is correctly selected (see section 9.1.1 SETTINGS FOR PH MEASUREMENTS, page 60).

Use one to five buffer solutions of the selected buffer set in any order. Below, calibration with Technical buffers (TEC) is described. When other buffer sets are used, other nominal buffer values are displayed. Apart from that, the procedure is identical.

If single-point calibration was set in the menu, the calibration procedure is automatically finished with the measurement of buffer solution 1 and the calibration record is displayed.

1. Connect the pH sensor to the meter. The pH measuring window is displayed.
2. Keep the buffer solutions ready. When measuring without temperature sensor: Temper the buffer solutions or measure the current temperature.
3. Start the calibration with <CAL>. The calibration display for the first buffer appears (voltage display).
4. Thoroughly rinse the sensor with deionized water.

5. Immerse the sensor in the first buffer solution.

6. For measurements without temperature sensor (e.g. when using an IDS adapter):
   Measure the temperature of the buffer manually and enter it with <↑><↓>.

7. Start the measurement with <ENTER>.
   The measured value is checked for stability (stability control). The [AR] status indicator is displayed. The measured parameter flashes.

8. Wait for the end of the measurement with stability control or accept the calibration value with <ENTER>.
   The calibration display for the next buffer appears (voltage display).

9. If necessary, finish the calibration procedure as a single-point calibration with <M>.
   The calibration record is displayed.

For **single-point calibration**, the instrument uses the Nernst slope (-59.2 mV/pH at 25 °C) and determines the zero point of the IDS pH sensor.

**Continuing with two-point calibration**

10. Thoroughly rinse the sensor with deionized water.

11. Immerse the pH sensor in buffer solution 2.
12. When measuring without temperature sensor:
   Measure the temperature of the buffer manually and enter it with 
   \(<\uparrow><\downarrow>\).

13. Start the measurement with <ENTER>.
   The measured value is checked for stability (stability control).
   The [AR] status indicator is displayed. The measured parameter
   flashes.

Continuing with three- to five-point calibration

14. Wait for the measurement with stability control to be completed or termi-
    nate the stability control and take over the calibration value with 
    <ENTER>.
    The calibration display for the next buffer appears (voltage display).

15. If necessary, finish the calibration procedure as a two-point calibration
    with <M>.
    The calibration record is displayed.

16. Thoroughly rinse the sensor with deionized water.

17. Immerse the sensor in the next buffer solution.

18. When measuring without temperature sensor:
    Measure the temperature of the buffer manually and enter it with 
    \(<\uparrow><\downarrow>\).

19. Start the measurement with <ENTER>.
    The measured value is checked for stability (stability control).
    The [AR] status indicator is displayed. The measured parameter
    flashes.
20. Wait for the measurement with stability control to be completed or terminate the stability control and take over the calibration value with <ENTER>. The calibration display for the next buffer appears (voltage display).

21. If necessary, use <M> to finish the calibration. The calibration record is displayed.
   or
   Switch to calibration with the next buffer with <ENTER>.

   Calibration is automatically completed after the last buffer of a buffer set has been measured. Then the calibration record is displayed.
   The calibration line is determined by linear regression.

5.2.4 Carrying out manual calibration (ConCal)

Make sure that in the sensor menu, Buffer menu, the ConCal buffer set is correctly selected (see section 9.1.1 SETTINGS FOR PH MEASUREMENTS, page 60).

Use any one to five buffer solutions in ascending or descending order.

   If single-point calibration was set in the menu, the calibration procedure is automatically finished with the measurement of buffer solution 1 and the calibration record is displayed.

1. Connect the pH sensor to the meter. The pH measuring window is displayed.

2. Keep the buffer solutions ready. When measuring without temperature sensor: Temper the buffer solutions or measure the current temperature.

3. Start the calibration with <CAL>. The calibration display for the first buffer appears (voltage display).

4. Thoroughly rinse the sensor with deionized water.
5. Immerse the pH sensor in buffer solution 1.

6. For measurements without temperature sensor (e.g. when using an IDS adapter):
   Measure the temperature of the buffer manually and enter it with <▲><▼>.

7. Start the measurement with <ENTER>.
   The measured value is checked for stability (stability control).
   The [AR] status indicator is displayed. The measured parameter flashes.

8. Wait for the measurement with stability control to be completed or terminate the stability control and take over the calibration value with <ENTER>.
   The pH value of the buffer solution is displayed.

9. Set the nominal buffer value for the measured temperature with <▲><▼>.

10. Accept the calibration value with <ENTER>.
    The calibration display for the next buffer appears (voltage display).

11. If necessary, finish the calibration procedure as a single-point calibration with <M>.
    The calibration record is displayed.

For **single-point calibration**, the instrument uses the Nernst slope (-59.2 mV/pH at 25 °C) and determines the zero point of the IDS pH sensor.
Continuing with two-point calibration

12. Thoroughly rinse the sensor with deionized water.
13. Immerse the pH sensor in buffer solution 2.
14. When measuring without temperature sensor:
   Measure the temperature of the buffer manually and enter it with
   \(<\uparrow<\downarrow>\).
15. Start the measurement with \(<\text{ENTER}\>\).
   The measured value is checked for stability (stability control).
   The [AR] status indicator is displayed. The measured parameter
   flashes.
16. Wait for the measurement with stability control to be completed or termi-
   nate the stability control and take over the calibration value with
   \(<\text{ENTER}\>.
   The pH value of the buffer solution is displayed.

<table>
<thead>
<tr>
<th>pH</th>

<tr>
<td>4.035</td>
<td>2</td>
</tr>
</tbody>
</table>

   01.07.2011
   08:00

17. Set the nominal buffer value for the measured temperature with
   \(<\uparrow<\downarrow>\).
18. Accept the calibration value with \(<\text{ENTER}\>.
   The calibration display for the next buffer appears (voltage display).
19. If necessary, finish the calibration procedure as a two-point calibration
   with \(<\text{M}\>.
   The calibration record is displayed.

Continuing with three- to five-point calibration

20. Thoroughly rinse the sensor with deionized water.
21. Immerse the sensor in the next buffer solution.
22. When measuring without temperature sensor:
   Measure the temperature of the buffer manually and enter it with
   \(<\uparrow<\downarrow>\).
23. Start the measurement with \(<\text{ENTER}\>.
   The measured value is checked for stability (stability control).
   The [AR] status indicator is displayed. The measured parameter
   flashes.
24. Wait for the measurement with stability control to be completed or terminate the stability control and take over the calibration value with <Enter>. The pH value of the buffer solution is displayed.

![pH measurement result]

25. Set the nominal buffer value for the measured temperature with <△><▼>.

26. Accept the calibration value with <Enter>. The calibration display for the next buffer appears (voltage display).

27. If necessary, use <M> to finish the calibration. The calibration record is displayed. or Continue calibrating using the next buffer with <Enter>.

After the fifth buffer has been measured the calibration is automatically finished. Then the calibration record is displayed. The calibration line is determined by linear regression.

5.2.5 Calibration points

Calibration can be performed using one to five buffer solutions in any order (single-point to five-point calibration). The meter determines the following values and calculates the calibration line as follows:

<table>
<thead>
<tr>
<th>Calibration</th>
<th>Determined values</th>
<th>Displayed calibration data</th>

<td>● Slope = S/Ip.</td>
</tr>
</tbody>
</table>
Multi 3510 IDS  

5.2.6 Calibration data

The calibration record is automatically transmitted to the interface after calibrating.

### Displaying the calibration data

The calibration record of the last calibration is to be found under the menu item, *Calibration / Calibration record*. To open it in the measured value display, press the `<CAL__>` key.

The calibration records of the last 10 calibrations are to be found in the menu, *Calibration / Calibration data storage / Display*. To open the *Calibration* menu, press the `<ENTER>` key in the measured value display.

<table>
<thead>
<tr>
<th>Menu item</th>
<th>Setting/function</th>
<th>Description</th>
</tr>
</thead>
</table>
| *Calibration / Calibration data storage / Display* | - | Displays the calibration records. Further options:  
- Scroll through the calibration records with `<▲>`<`▼`>.  
- Output the displayed calibration record to the interface with `<F2>`/[USB output].  
- Output all calibration records to the interface with `<F2__>`/[USB output].  
- Quit the display with `<F1>`/[Back] or `<ENTER>`.  
- Switch directly to the measured value display with `<M>`.

| *Calibration / Calibration data storage / Output to RS232/USB* | - | Outputs the calibration data storage to the interface |
After calibrating, the meter automatically evaluates the calibration. The zero point and slope are evaluated separately. The worse evaluation of both is taken into account. The evaluation appears on the display and in the calibration record.

5.2.7 Continuous measurement control (CMC function)

The Continuous Measurement Control (CMC function) facilitates to evaluate the current measured value instantly and definitely.

After each successful calibration the scale of the pH measuring range is displayed in the measured value display. Here you can very clearly see whether or not the current measured value is in the calibrated part of the measuring range.

The following information is displayed:

1. Currently measured pH value (needle)
2. Marking lines for all nominal buffer values used with the last valid calibration
3. Measuring range for which a valid calibration is available. Measured values in this range are suitable for documentation.
4. Measuring range for which no valid calibration is available (shaded). Measured values in this range are not suitable for documentation. Calibrate the meter with buffers covering this measuring range.

The limits of the calibrated range are determined by the buffers used for calibration:

Lower limit: Buffer with lowest pH value - 2 pH units
Upper limit: Buffer with highest pH value + 2 pH units
5.2.8 QSC function (sensor quality control)

**General information on the QSC function**

The QSC function (Quality Sensor Control) is a new sensor evaluation for digital IDS sensors. It evaluates the condition of an IDS pH sensor individually and with a very fine grading.

The QSC scale shows the current sensor evaluation with an indicator on the display.

In the USB output the sensor evaluation is given as a percentage (1-100).

The finely graded sensor evaluation of the QSC function promptly calls your attention to changes of the sensor. Thus you can do what is necessary to restore the optimum measuring quality (e.g. clean, calibrate or replace the sensor).

### Sensor evaluation with / without QSC function

<table>
<thead>
<tr>
<th>With QSC function</th>
<th>Without QSC function (sensor symbol)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Very fine grading of the sensor evaluation (100 grades)</td>
<td>Rough grading of the sensor evaluation (4 grades)</td>
</tr>
<tr>
<td>The reference value is individually determined for each sensor during the QSC initial calibration.</td>
<td>A theoretical reference value is used for all sensors</td>
</tr>
<tr>
<td>Low tolerances for zero point and slope when using QSC buffer solutions</td>
<td>Greater tolerances for zero point and slope when using commercial buffer sets</td>
</tr>
<tr>
<td>Additional QSC calibration required (with special QSC buffer set)</td>
<td>No additional calibration required</td>
</tr>
</tbody>
</table>

### QSC calibration

The QSC function is enabled by once carrying out an additional three-point calibration with special QSC buffer solutions. It covers the measuring range of the sensor (pH 2 to pH 11). The QSC initial calibration determines the actual condition of the sensor and stores it as a reference in the sensor. To meet the high requirements of a QSC initial calibration, the QSC initial calibration should optimally be carried out with the initial commissioning of the sensor.
Carry out the normal calibrations for your special measuring range with your usual standard solutions as previously done.

As soon as the QSC function was enabled for an IDS sensor, it is not possible to return to the sensor evaluation with the sensor symbol for this sensor.

Carrying out a QSC initial calibration

1. Open the menu for measurement settings with <ENTER>.
2. In the QSC menu, select First calibration with <▲><▼>. The calibration display appears. AutoCal QSC-Kit is displayed as the buffer.
   Exclusively use the QSC-Kit for the QSC calibration. If you use other buffers, you will have no valid QSC calibration.

   ![Calibration display with AutoCal QSC-Kit]

3. Calibration with the buffers of the QSC-Kit is done like a normal three-point calibration.
   Follow the user guide.

   Carry out the QSC initial calibration very carefully. It determines the reference value for the sensor. This reference value cannot be overwritten or reset.
   As soon as the QSC function was enabled, it is not possible to return to the sensor evaluation with the sensor symbol.

4. As soon as the three-point calibration has been successfully carried out you can decide whether to accept or discard the calibration as the QSC initial calibration.

   The QSC initial calibration is completed. The sensor is calibrated. If you want to calibrate with special buffers for your measurements, you can subsequently carry out a normal calibration with your buffers. The reference values determined with the QSC calibration are also used for the evaluation of normal calibrations. In the measured value display, the QSC scale of the QSC function is always displayed. A double arrow on the QSC scale indicates the current sen-
Carrying out a QSC control calibration

A QSC control calibration can, e.g. be useful if the sensor evaluation noticeably changed (after some normal calibrations).

You can carry out QSC control calibrations at greater intervals than normal calibrations.

1. Open the menu for measurement settings with <ENTER>.
2. In the QSC menu, select Control calibration with <▲><▼>. The calibration display appears. AutoCal QSC-Kit is displayed as the buffer. Exclusively use the QSC-Kit for the QSC calibration. If you use other buffers, you will have no valid QSC control calibration.
3. Follow the user guide. The calibration is carried out like a normal three-point calibration. As soon as the three-point calibration has been successfully carried out you can decide whether to accept or discard the calibration as the QSC control calibration.
6 ORP

6.1 Measuring

6.1.1 Measuring the ORP

**NOTE**
When connecting a grounded PC/printer, measurements cannot be performed in grounded media as the values would be incorrect. The USB interface is not galvanically isolated.

IDS ORP sensors are not calibrated. However, you can check IDS ORP sensors using a test solution.

1. Connect the ORP sensor to the meter. The ORP measuring window is displayed.
2. Adjust the temperature of the solutions and measure the current temperature if the measurement is made without a temperature sensor.
3. Check the meter with the ORP sensor.
4. Immerse the ORP sensor in the test sample.

<table>
<thead>
<tr>
<th>U</th>
<th>157.0 mV</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>24.8 °C</td>
</tr>
</tbody>
</table>

**Stability control (AutoRead) & HOLD function**

The stability control function *(AutoRead)* continually checks the stability of the measurement signal. The stability has a considerable impact on the reproducibility of measured values.

The measured parameter flashes on the display
- as soon as the measured value is outside the stability range
- when the automatic *Stability control* is switched off.

You can start the *Stability control* manually at any time, irrespective of the setting for automatic *Stability control* (see section 9.5.3 AUTOMATIC STABILITY CONTROL, page 69) in the *System* menu.

1. Freeze the measured value with <AR>. The [HOLD] status indicator is displayed. The HOLD function is active.
You can terminate the Stability control function and the HOLD function with <AR> or <M> at any time.

2. Using <ENTER>, activate the Stability control function manually. The [AR] status indicator appears while the measured value is assessed as not stable. A progress bar is displayed and the display of the measured parameter flashes. The [HOLD][AR] status indicator appears as soon as a stable measured value is recognized. The progress bar disappears and the display of the measured parameter stops flashing. The current measurement data is output to the interface. Measurement data meeting the stability control criterion is marked by AR.

You can prematurely terminate the Stability control function manually with <ENTER> at any time. If the Stability control function is prematurely terminated, the current measurement data are output to the interface without the AutoRead info.

3. Using <ENTER>, start a further measurement with stability control. or Release the frozen measured value again with <AR> or <M>. The [AR] status display disappears. The display switches back to the previous indication.

Criteria for a stable measured value

The Stability control function checks whether the measured values are stable within the monitored time interval.

<table>
<thead>
<tr>
<th>Measured parameter</th>
<th>Time interval</th>
<th>Stability in the time interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORP</td>
<td>15 seconds</td>
<td>( \Delta : \text{Better than 0.3 mV} )</td>
</tr>
<tr>
<td>Temperature</td>
<td>15 seconds</td>
<td>( \Delta : \text{Better than 0.5 °C} )</td>
</tr>
</tbody>
</table>

The minimum duration until a measured value is assessed as stable is the monitored time interval. The actual duration is mostly longer.
6.1.2 Measuring the temperature

For reproducible ORP measurements, it is essential to measure the temperature of the test sample.

When operating a sensor without integrated temperature sensor, you first have to measure and enter the temperature of the sample.

The measuring instrument recognizes whether a suitable sensor is connected and automatically switches on the temperature measurement.

The display of the temperature indicates the active temperature measuring mode:

<table>
<thead>
<tr>
<th>Temperature sensor</th>
<th>Resolution of the temp. display</th>
<th>Temp. measurement</th>
</tr>
</thead>
<tbody>
<tr>
<td>yes</td>
<td>0.1 °C</td>
<td>Automatic with temperature sensor</td>
</tr>
<tr>
<td>-</td>
<td>1 °C</td>
<td>Manual</td>
</tr>
</tbody>
</table>

6.2 ORP calibration

ORP electrodes are not calibrated. You can, however, check ORP electrodes by measuring the ORP of a test solution and comparing the value with the nominal value.
7 Dissolved oxygen

7.1 Measuring

7.1.1 Measuring D.O.

1. Connect the IDS D.O. sensor to the meter. The D.O. measuring screen is displayed.
2. If necessary, select the measured parameter with <M>.
3. Check or calibrate the meter with the sensor.

Only in special cases does the FDO® 925 D.O. sensor require calibration. A regular FDO® Check is sufficient.

4. Immerse the IDS D.O. sensor in the test sample.

---

**Selecting the displayed measured parameter**

You can switch between the following displays with <M>:

- D.O. concentration [mg/l]
- D.O. saturation [%]
- D.O. partial pressure [mbar].

**Salinity correction**

When measuring the D.O. concentration [mg/l] of solutions with a salt content of more than 1 g/l, a salinity correction is required. For this, you have to measure and input the salinity of the measured medium first.

When the salinity correction is switched on, the [Sal] indicator is displayed in the measuring screen.

You can switch the salinity correction on or off and enter the salinity in the menu for calibration and measurement settings (see section 9.3.1 SETTINGS FOR D.O. SENSORS (MENU FOR MEASUREMENT AND CALIBRATION SETTINGS), page 64).

**Air pressure correction**

The integrated air pressure sensor of the Multi 3510 IDS measures the current air pressure. The air pressure is automat-
ically used for air pressure correction during calibrating and for the display of the oxygen saturation [%] parameter. 

current air pressure when an IDS D.O. sensor is connected. You can view the current air pressure in the sensor menu when an IDS D.O. sensor is connected. Press the `<ENTER>` key in the measured value display. The current air pressure is displayed as an info message.

### Stability control (AutoRead) & HOLD function

The stability control function (*AutoRead*) continually checks the stability of the measurement signal. The stability has a considerable impact on the reproducibility of measured values.

- The measured parameter flashes on the display
  - as soon as the measured value is outside the stability range
  - when the automatic *Stability control* is switched off.

Irrespective of the setting for automatic *Stability control* (see section 9.5.3 *Automatic Stability Control, page 69*) in the *System* menu, you can start a measurement with *Stability control* manually at any time.

1. Freeze the measured value with `<AR>`.
   - The [HOLD] status indicator is displayed.
   - The HOLD function is active.

   ![Info](https://via.placeholder.com/150)
   
   You can terminate the *Stability control* function and the HOLD function with `<AR>` or `<M>` at any time.

2. Using `<ENTER>`, activate the *Stability control* function manually.
   - The [AR] status indicator appears while the measured value is assessed as not stable. A progress bar is displayed and the display of the measured parameter flashes.
   - The [HOLD][AR] status indicator appears as soon as a stable measured value is recognized. The progress bar disappears and the display of the measured parameter stops flashing.
   - The current measurement data is output to the interface. Measurement data meeting the stability control criterion is marked by AR.

   ![Info](https://via.placeholder.com/150)
   
   You can prematurely terminate the *Stability control* function manually with `<ENTER>` at any time. If the *Stability control* function is prematurely terminated, the current measurement data are output to the interface without the AutoRead info.

3. Using `<ENTER>`, start a further measurement with stability control.
   - or
   - Release the frozen measured value again with `<AR>` or `<M>`.
   - The [AR] status display disappears. The display switches back to the previous indication.
Criteria for a stable measured value

The Stability control function checks whether the measured values are stable within the monitored time interval.

<table>
<thead>
<tr>
<th>Measured parameter</th>
<th>Time interval</th>
<th>Stability in the time interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>D.O. concentration</td>
<td>20 seconds</td>
<td>Δ : better than 0.03 mg/l</td>
</tr>
<tr>
<td>D.O. saturation</td>
<td>20 seconds</td>
<td>Δ : better than 0.4 %</td>
</tr>
<tr>
<td>D.O. partial pressure</td>
<td>20 seconds</td>
<td>Δ : Better than 0.8 mbar</td>
</tr>
<tr>
<td>Temperature</td>
<td>15 seconds</td>
<td>Δ : Better than 0.5 °C</td>
</tr>
</tbody>
</table>

The minimum duration until a measured value is assessed as stable is the monitored time interval. The actual duration is mostly longer.

7.1.2 Measuring the temperature

For reproducible D.O. measurements, it is essential to measure the temperature of the test sample.

IDS D.O. sensors measure the temperature with a temperature sensor integrated in the IDS sensor.
7.2  FDO® Check procedure

7.2.1  Why should you check the sensor?

With the FDO® Check procedure, you can find out in a simple manner whether the FDO® 925 D.O. sensor should be cleaned or calibrated.

7.2.2  When should you check the sensor?

Checking can be useful in the following cases:

- When the check interval has expired (The [check] status indicator is displayed.)
- If the measured values seem to be implausible
- If you assume that the sensor cap is contaminated or at the end of its lifetime
- After the sensor cap was exchanged
- Routinely within the framework of the company quality assurance

7.2.3  Carrying out the FDO® Check procedure

**FDO® Check procedure**

Check in water vapor-saturated air.

Use the check and storage beaker (FDO® Check) to carry out the FDO® Check procedure.

**Stability control (AutoRead)**

In the FDO® Check procedure, the Stability control function (AutoRead) is automatically activated.

Proceed as follows to carry out the FDO® Check procedure:

1. Connect the D.O. sensor to the meter.
2. Place the D.O. sensor in the check and storage beaker, FDO® Check.

   The sponge in the check and storage beaker must be moist (not wet). Leave the sensor in the check and storage beaker long enough so it can adapt to the ambient temperature.

3. Start the FDO® Check procedure in the measuring menu with FDO Check / Start FDO Check.
   The meter switches to the measured parameter, %.
4. Start the measurement with **<ENTER>**. The measured value is checked for stability (stability control). The [AR] status indicator is displayed. The measured parameter flashes.

5. Wait for the end of the AutoRead measurement ([HOLD][AR]) status indicator or take over the measured value with **<ENTER>**. The measured value is frozen.

6. Switch to the measured value display with **<M>**. The check measurement is not documented.

### 7.2.4 Evaluation

The evaluation is based on the accuracy required by the used. Together with the nominal value (100 %) this results in a validity scope for the check.

If the measured value is within the validity scope, no cleaning or user calibration is required.

If the measured value is outside the validity scope, the sensor shaft and membrane should be cleaned, and the check should then be repeated (see section 5.4.1).

Example:

- Required accuracy: ± 2 %.
- In water vapor-saturated air or air-saturated water, the nominal value for the relative D.O. saturation (abbreviated: saturation) is 100 %.
- Therefore, the validity scope is 98 ... 102 %
- The check resulted in a measured value of 99.3 %

The measurement error is within the specified validity scope. No cleaning or user calibration is required.
7.3 Calibration

7.3.1 Why calibrate?

D.O. sensors age. This changes the slope of the D.O. sensor. Calibration determines the current slope of the sensor and stores this value in the instrument.

The FDO® 925 D.O. sensor ages so little it does not have to be regularly calibrated.

To detect changes of the sensor as early as possible, the FDO® Check procedure can be useful (see section 7.2 FDO® CHECK PROCEDURE, page 47).

7.3.2 When to calibrate?

- If your evaluation of the FDO® Check procedure suggests the necessity of a calibration
- When the calibration interval has expired
- When your accuracy requirements are especially high
- Routinely within the framework of the company quality assurance

7.3.3 Calibration procedures

The Multi 3510 IDS provides 2 calibration procedures:

- Calibration in water vapor-saturated air.
  Use an OxiCal® air calibration vessel for calibration.

- Calibration via a comparison measurement (e.g. Winkler titration according to DIN EN 25813 or ISO 5813). At the same time, the relative slope is adapted to the comparison measurement by a correction factor. When the correction factor is active, the [Factor] indicator appears in the measuring screen.

7.3.4 Calibration in water vapor-saturated air

Use the check and storage beaker (FDO® Check) to calibrate the FDO® 925 sensor.

Proceed as follows to calibrate the D.O. sensor:

1. Connect the D.O. sensor to the meter.
2. Place the FDO® 925 D.O. sensor in the check and storage beaker, FDO® Check.

The sponge in the check and storage beaker must be moist (not wet). Leave the sensor in the check and storage beaker long enough so it can adapt to the ambient temperature.
3. Start the calibration with <CAL>.
   The last calibration data (relative slope) is displayed.

   ![Calibration Screen](image)

4. Start the measurement with <ENTER>.
   The measured value is checked for stability (stability control).
   The [AR] status indicator is displayed. The measured parameter flashes.

5. Wait for the end of the AutoRead measurement ([HOLD][AR]) status indicator.
   The calibration record is displayed and output to the interface.

6. Switch to the measured value display with <ENTER>.

7.3.5 Calibration by means of a *Comparison meas.* (FDO Comp)

For this calibration procedure, the *Comparison meas.* setting must be set to *on* in the *Calibration* menu.

Before calibrating via a comparison measurement, the sensor should be calibrated in the air calibration vessel.

Proceed as follows to calibrate the instrument:

1. Connect the D.O. sensor to the measuring instrument.
2. Immerse the D.O. sensor in the reference solution.
3. Start the calibration with <CAL>. 
4. Start the measurement with <ENTER>. The measured value is checked for stability (stability control). The [AR] status indicator is displayed. The measured parameter flashes.

5. Wait for the end of the AutoRead measurement or accept the calibration value with <ENTER>. The factor that was set last is displayed.

6. Using <▲> <▼>, set the correction factor to adjust the displayed concentration value to the nominal value (value of the comparison measurement). Subsequently, accept the correction factor with <ENTER>. The measuring instrument switches to the measured value display. The status display [Factor] is active.

7.3.6 Calibration data

The calibration record is automatically transmitted to the interface after calibrating.

The calibration record of the last calibration is to be found under the menu item, Calibration / Calibration record. To open it in the measured value display, press the <CAL__> key.

The calibration records of the last 10 calibrations are to be found in the menu, Calibration / Calibration data storage / Display. To open the Calibration menu,
press the **<ENTER>** key in the measured value display.

<table>

8 Conductivity

8.1 Measuring

8.1.1 Measuring the conductivity

**NOTE**
When connecting a grounded PC/printer, measurements cannot be performed in grounded media as the values would be incorrect. The USB interface is not galvanically isolated.

1. Connect the conductivity sensor to the meter. The conductivity measuring window is displayed. The measuring cell and cell constant for the connected IDS conductivity sensor are automatically taken over.
2. If necessary, select the measured parameter with <M>.
3. Immerse the conductivity sensor in the test sample.

You can switch between the following displays with <M>:
- Conductivity [μS/cm] / [mS/cm]
- Resistivity [Ω·cm] / [kΩ·cm] / [MΩ·cm]
- Salinity SaL [ ]
- Total dissolved solids TDS [mg/l] / [g/l]

The multiplier to calculate the total dissolved solids is set to 1.00 in the factory. You can adjust this multiplier to meet your requirements in the range 0.40 ... 1.00. The multiplier is set in the menu for the parameter, TDS.

The stability control function (AutoRead) continually checks the stability of the measurement signal. The stability has a considerable impact on the reproducibility of measured values.

The measured parameter flashes on the display
- as soon as the measured value is outside the stability range
- when the automatic Stability control is switched off.

You can start the Stability control manually at any time, irrespective of the set-
ting for automatic Stability control (see section 9.5.3 AUTOMATIC STABILITY CONTROL, page 69) in the System menu.

1. Freeze the measured value with <AR>.
The [HOLD] status indicator is displayed.
The HOLD function is active.

    You can terminate the Stability control function and the HOLD function with <AR> or <M> at any time.

2. Using <ENTER>, activate the Stability control function manually.
The [AR] status indicator appears while the measured value is assessed as not stable. A progress bar is displayed and the display of the measured parameter flashes.
The [HOLD][AR] status indicator appears as soon as a stable measured value is recognized. The progress bar disappears and the display of the measured parameter stops flashing.
The current measurement data is output to the interface. Measurement data meeting the stability control criterion is marked by AR.

    You can prematurely terminate the Stability control function manually with <ENTER> at any time. If the Stability control function is prematurely terminated, the current measurement data are output to the interface without the AutoRead info.

3. Using <ENTER>, start a further measurement with stability control.
or
Release the frozen measured value again with <AR> or <M>.
The [AR] status display disappears. The display switches back to the previous indication.

Criteria for a stable measured value

The Stability control function checks whether the measured values are stable within the monitored time interval.

<table>
<thead>
<tr>
<th>Measured parameter</th>
<th>Time interval</th>
<th>Stability in the time interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conductivity $\chi$</td>
<td>10 seconds</td>
<td>$\Delta \chi$: better than 1.0% of measured value</td>
</tr>
<tr>
<td>Temperature</td>
<td>15 seconds</td>
<td>$\Delta$: Better than 0.5 °C</td>
</tr>
</tbody>
</table>

The minimum duration until a measured value is assessed as stable is the monitored time interval. The actual duration is mostly longer.

8.1.2 Measuring the temperature

For reproducible conductivity measurements, it is essential to measure the
temperature of the test sample.

IDS sensors measure the temperature with a temperature sensor integrated in the IDS sensor.

### 8.2 Temperature compensation

The calculation of the temperature compensation is based on the preset reference temperature, 20 °C or 25 °C. It appears on the display as $Tr_{20}$ or $Tr_{25}$.

You can select one of the following temperature compensation methods:

- **Nonlinear temperature compensation** ($nLF$) according to EN 27 888
- **Linear temperature compensation** ($Lin$) with adjustable coefficients of 0.000 ... 3.000 %/K
- **No temperature compensation** (off)

The reference temperature and temperature compensation are set in the menu for the parameter, conductivity (see section 9.4.1 SETTINGS FOR IDS CONDUCTIVITY SENSORS, page 66).

### Application tips

Select the following temperature compensations given in the table according to the respective test sample:

<table>
<thead>
<tr>
<th>Test sample</th>
<th>Temperature compensation</th>

<td>$nLF$</td>
</tr>
<tr>
<td>Other aqueous solutions</td>
<td>$Lin$ Set linear temperature coefficient 0.000 ... 10.000 %/K</td>
<td>$Lin$</td>
</tr>
<tr>
<td>Salinity (seawater)</td>
<td>Automatic $nLF$ according to IOT (International Oceanographic Tables)</td>
<td>$Sal$, $nLF$</td>
</tr>
</tbody>
</table>
8.3 Calibration

8.3.1 Why calibrate?

Aging slightly changes the cell constant, e.g. due to coatings. As a result, an inexact measured value is displayed. The original characteristics of the cell can often be restored by cleaning the cell. Calibration determines the current value of the cell constant and stores this value in the meter. Thus, you should calibrate at regular intervals.

8.3.2 When to calibrate?

- After connecting a sensor
- Routinely within the framework of the company quality assurance
- When the cleaning interval has expired

8.3.3 Determining the cell constant (calibration in control standard)

You can determine the actual cell constant of the IDS conductivity sensor by calibrating with the control standard in the following range:

0.450 cm\(^{-1}\) ... 0.500 cm\(^{-1}\) (e.g. TetraCon 925, nominal cell constant 0.475 cm\(^{-1}\))

The cell constant is determined in the control standard, 0.01 mol/l KCl.

In the delivery condition, the calibrated cell constant of the IDS sensor is set to 0.475 cm\(^{-1}\) (conductivity measuring cell, TetraCon 925).

For this calibration procedure, the Type setting must be set to cal. Proceed as follows to determine the cell constant:

1. Connect the conductivity sensor to the meter.
2. In the measured value display, select the conductivity parameter with <M>.
3. Start the calibration with <CAL>.
   The cell constant that was calibrated last is displayed.

\[
\text{0.475 cm}^{-1} \\
25.0 \degree \text{C}
\]

\[
03.04.2013 \\
08:00
\]
4. Immerse the conductivity sensor in the control standard solution, 0.01 mol/l KCl.

5. Start the measurement with <ENTER>. The measured value is checked for stability (stability control). The [AR] status indicator is displayed. The measured parameter flashes.

6. Wait for the end of the measurement with stability control ([HOLD][AR]) status indicator or take over the calibrated value with <ENTER>. The calibration record is displayed and output to the interface.

7. Switch to the measured value display with <ENTER>.

8.3.4 Calibration data

The calibration record is automatically transmitted to the interface after calibrating.

Displaying the calibration record

The calibration data can be displayed and then output to the interface.

The calibration record of the last calibration is to be found under the menu item, Calibration / Calibration record. To open it in the measured value display, press the <CAL__> key.

The calibration records of the last 10 calibrations are to be found in the menu, Calibration / Calibration data storage / Display. To open the Calibration menu, press the <ENTER> key in the measured value display.

<table>
<thead>
<tr>
<th>Menu item</th>

**9.1.3 Calibration interval**

The calibration evaluation is displayed as a sensor symbol.

After the QSC function has been enabled the sensor symbol is replaced by the QSC scale (see section 5.2.8 QSC FUNCTION (SENSOR QUALITY CONTROL), page 38).

After the specified calibration interval has expired the sensor symbol or the QSC scale flashes. It is still possible to measure.

To ensure the high measuring accuracy of the measuring system, calibrate after the calibration interval has expired.

The buffers are selected in the menu, pH / <ENTER> / Calibration / Buffer (see section 9.1.1 SETTINGS FOR PH MEASUREMENTS, page 60).

---

**Setting the calibration interval**

The calibration interval is set to 7 days in the factory.
You can change the interval (1 ... 999 days):

1. Open the menu for measurement settings with <ENTER>.
2. In the Calibration / Calibration interval menu, set the calibration interval with <▲><▼>.
3. Confirm the setting with <ENTER>.
4. Quit the menu with <M>.

9.2 ORP measurement settings

9.2.1 Settings for ORP measurements

The settings are made in the menu for measuring settings of the ORP measurement. To open the settings, display the required measured parameter in the measured value display and press the <ENTER> key. After completing the settings, switch to the measured value display with <M>.

Default settings are printed in **bold**.

### 9.4 Cond measurement settings

#### 9.4.1 Settings for IDS conductivity sensors

The settings are made in the menu for the measured parameter, conductivity. To open the settings, display the required measured parameter in the measured value display and press the <ENTER> key. After completing the settings, switch to the measured value display with <M>.

The possible settings are individually displayed for each sensor. Below the setting menu is displayed for two IDS sensors (TetraCon 925, LR 925/01).

Default settings are printed in **bold**.

<table>

</table>
9.5.2 Data storage

This menu contains all functions to display, edit and erase stored measured values.

Detailed information on the memory functions of the Multi 3510 IDS are given in section 10 DATA STORAGE, page 73.

9.5.3 Automatic Stability control

The automatic Stability control (AutoRead) function continuously checks the stability of the measurement signal. The stability has a considerable impact on the reproducibility of measured values.

You can activate or switch off the automatic Stability control function (see section 9.5 SENSOR-INDEPENDENT SETTINGS, page 68).

The measured parameter flashes on the display

- as soon as the measured value is outside the stability range
- when the automatic Stability control is switched off.

9.5.4 Automatic shutoff function

The instrument has an automatic shutoff function in order to save the batteries (see section 9.5.1 SYSTEM, page 68). The automatic shutoff function switches off the meter if no key is pressed for an adjustable period.

The automatic shutoff function is not active

- if the power pack is connected
- if a USB-B cable is connected
- if the Automatic data storage function is active, or with automatic data transmission

9.5.5 Display illumination

The meter automatically switches off the display illumination if no key is pressed for 20 seconds.

The illumination is switched on with the next keystroke again.
9.6 Reset

You can reset (initialize) all sensor settings and sensor-independent settings separately from each other.

9.6.1 Resetting the measurement settings

The calibration data are reset to the default settings together with the measuring parameters. Recalibrate after performing a reset.

**pH** The following settings for pH measurements are reset to the default settings with the *Reset* function:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default settings</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Buffer</em></td>
<td>TEC</td>
</tr>
<tr>
<td><em>Calibration interval</em></td>
<td>7 d</td>
</tr>
<tr>
<td><em>Unit for slope</em></td>
<td>mV/pH</td>
</tr>
<tr>
<td><em>Measured parameter</em></td>
<td>pH</td>
</tr>
<tr>
<td><em>Unit for slope</em></td>
<td>0.001</td>
</tr>
<tr>
<td><em>mV resolution</em></td>
<td>0.1</td>
</tr>
<tr>
<td><em>Asymmetry</em></td>
<td>0 mV</td>
</tr>
<tr>
<td><em>Slope</em></td>
<td>-59.2 mV</td>
</tr>
<tr>
<td><em>Man. temperature</em></td>
<td>25 °C</td>
</tr>
<tr>
<td><em>Single-point calibration</em></td>
<td>off</td>
</tr>
</tbody>
</table>

The sensor settings are reset under the *Reset* menu item in the menu for calibration and measurement settings. To open the settings, display the required measured parameter in the measured value display and press the `<ENTER>` key.
ORP

The following settings for ORP measurements are reset to the default settings with the Reset function:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>mV resolution</td>
<td>0.1</td>
</tr>
<tr>
<td>Man. temperature</td>
<td>25 °C</td>
</tr>
</tbody>
</table>

The sensor settings are reset under the Reset menu item in the menu for calibration and measurement settings. To open the settings, display the required measured parameter in the measured value display and press the <ENTER> key.

Dissolved oxygen

The following settings for D.O. measurements are reset to the default settings with the Reset function:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calibration interval</td>
<td>180 d</td>
</tr>
<tr>
<td>Check interval</td>
<td>60 d</td>
</tr>
<tr>
<td>Measured parameter</td>
<td>D.O. concentration (mg/l)</td>
</tr>
<tr>
<td>Relative slope ($S_{Rel}$)</td>
<td>1.00</td>
</tr>
<tr>
<td>Salinity (value)</td>
<td>0.0</td>
</tr>
<tr>
<td>Salinity (function)</td>
<td>off</td>
</tr>
</tbody>
</table>

The sensor settings are reset under the Reset menu item in the menu for calibration and measurement settings. To open the settings, display the required measured parameter in the measured value display and press the <ENTER> key.

Conductivity

The following settings for conductivity measurements are reset to the default settings with the Reset function:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calibration interval</td>
<td>150 d</td>
</tr>
<tr>
<td>Measured parameter</td>
<td>$\kappa$</td>
</tr>
<tr>
<td>Cell constant (c)</td>
<td>Depending on the connected measuring cell: 0.475 cm$^{-1}$ (calibrated) 0.475 cm$^{-1}$ (set) 0.100 cm$^{-1}$</td>
</tr>
<tr>
<td>Temperature compensation</td>
<td>nLF</td>
</tr>
<tr>
<td>Reference temperature</td>
<td>25 °C</td>
</tr>
<tr>
<td>Temperature coefficient (TC)</td>
<td>2.000 %/K</td>
</tr>
<tr>
<td>of the linear temperature compensation</td>
<td></td>
</tr>
<tr>
<td>Multiplier for TDS</td>
<td>1.00</td>
</tr>
</tbody>
</table>
The sensor settings are reset under the *Reset* menu item in the menu for calibration and measurement settings. To open the settings, display the required measured parameter in the measured value display and press the `<ENTER>` key.

### 9.6.2 Resetting the system settings

The following system settings can be reset to the default condition:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default settings</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Language</strong></td>
<td>English</td>
</tr>
<tr>
<td><strong>Audio signal</strong></td>
<td>on</td>
</tr>
<tr>
<td><strong>Baud rate</strong></td>
<td>4800 Baud</td>
</tr>
<tr>
<td><strong>Output format</strong></td>
<td>ASCII</td>
</tr>
<tr>
<td><strong>Decimal separator</strong></td>
<td>.</td>
</tr>
<tr>
<td><strong>Contrast</strong></td>
<td>50</td>
</tr>
<tr>
<td><strong>Illumination</strong></td>
<td>Auto</td>
</tr>
<tr>
<td><strong>Shutoff time</strong></td>
<td>1 h</td>
</tr>
<tr>
<td><strong>Temperature unit</strong></td>
<td>°C</td>
</tr>
<tr>
<td><strong>Stability control</strong></td>
<td>on</td>
</tr>
</tbody>
</table>

The system settings are reset in the menu, *Storage & config / System / Reset*. To open the *Storage & config* menu, press the `<ENTER>` key in the measured value display.
10 Data storage

You can save measured values (datasets) to the data storage:

- Manual data storage (see section 10.1 MANUAL DATA STORAGE, page 73)
- Automatic data storage at intervals (see section 10.2 AUTOMATIC DATA STORAGE AT INTERVALS, page 74)

Each data storage process transmits the current dataset to the USB interface.

10.1 Manual data storage

You can save a measurement dataset to the data storage as follows. The dataset is at the same time output to the USB interface:

1. Press the <STO> key shortly.
   The menu for manual data storage appears.

2. If necessary, change and confirm the ID number (1 ... 10000) with <▲><▼> and <ENTER>.
   The dataset is stored. The meter switches to the measured value display.

If the data storage is full When all data storage locations are occupied, it is not possible to continue storing. Then you can e.g. transmit the stored data to a PC (see section 10.3.1 EDITING THE MEASURED VALUE DATA STORAGE, page 76) and subsequently erase the data storage (see section 10.3.2 ERASING THE MEASUREMENT DATA STORAGE, page 77).
10.2 Automatic data storage at intervals

The data storage interval (Interval) determines the time interval between automatic data storage processes. Each data storage process transmits the current dataset to the USB interface.

Configuring the automatic data storage function

1. Press the <STO_> key.
   The menu for automatic data storage appears.

   ![Automatic data storage menu]

   - 1 Adjusted entire data storage duration
   - 2 Max. available data storage duration
   - 3 Graphical display of the data storage usage

Settings

You can configure the automatic data storage function with the following settings:

<table>
<thead>
<tr>
<th>Menu item</th>
<th>Possible setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID number</td>
<td>1 ... 10000</td>
<td>ID number for the dataset series.</td>
</tr>
<tr>
<td>Interval</td>
<td>1 s, 5 s, 10 s, 30 s, 1 min, 5 min, 10 min, 15 min, 30 min, 60 min</td>
<td>Storage interval. The lower limit of the storage interval can be restricted by the number of free storage locations. The upper limit is restricted by the storage duration.</td>
</tr>
<tr>
<td>Duration</td>
<td>1 min ... x min</td>
<td>Storage duration. Specifies after which time the automatic data storage should be terminated. The lower limit of the storage duration is restricted by the storage interval. The upper limit is restricted by the number of free storage locations.</td>
</tr>
</tbody>
</table>
Starting the automatic data storage function

To start the automatic data storage function, select *continue* with `<▲>`<▼> and confirm with `<ENTER>`. The meter switches to the measured value display.

<table>
<thead>
<tr>
<th>pH</th>
<th>0</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.007</td>
<td></td>
<td></td>
</tr>
<tr>
<td>25.0 °C</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

1 Remaining storage duration
2 Graphical display of the storage duration

The active automatic data storage function can be recognized by the progress bar in the status line. The progress bar indicates the remaining storage duration.

If the automatic data storage function is activated, only the following keys are active: `<M>`, `<STO_>` and `<On/Off>`. The other keys and the automatic switch-off function are deactivated.

Terminating the automatic data storage function prematurely

Proceed as follows to switch off the automatic data storage function before the adjusted storage duration has expired:

1. Press the `<STO_>` key.
   The following window appears.

2. Using `<▲>`<▼>, select *yes* and confirm with `<ENTER>`.
   The meter switches to the measured value display.
   The automatic data storage function is terminated.
10.3 Measured value data storage

10.3.1 Editing the measured value data storage

The contents of the manual or automatic measurement data storage can be shown on the display.

Each of the measurement data storages has a function to erase the entire contents.

Editing the data storage

The data storage is edited in the menu, Storage & config / Data storage. To open the Storage & config menu, press the <ENTER> key in the measured value display.

Open the manual or automatic data storage directly with the <RCL> or <RCL__> key.

The settings are explained here using the manual data storage as an example. The same settings and functions are available for the automatic data storage.

### Settings

<table>
<thead>
<tr>
<th>Menu item</th>
<th>Setting/function</th>
<th>Description</th>
</tr>
</thead>
</table>
| Data storage / Manual data storage / Display | - | Displays all measurement datasets page by page.  
Further options:  
• Scroll through the datasets with <▲><▼>.  
• Output the displayed dataset to the interface with <F2> /[USB output].  
• Quit the display with <F1>/ [Back]. |
| Data storage / Manual data storage / Output to RS232/USB | - | Outputs all stored measurement data to the interface. |
| Data storage / Manual data storage / Erase | - | Erases the entire manual measurement data storage.  
Note:  
All calibration data remain stored when this action is performed. |
10.3.2 Erasing the measurement data storage

Erasing the measurement data storage (see section 10.3.1 EDITING THE MEASURED VALUE DATA STORAGE, page 76).

10.3.3 Measurement dataset

A complete dataset includes:

- Date/time
- Meter name, series number
- Sensor name, series number
- ID number
- Measured value of the connected sensor
- Measured temperature value of the connected sensor
- AutoRead info: AR appears with the measured value if the AutoRead criterion was met while storing (stable measured value). Otherwise, the AR display is missing.
- Calibration evaluation:
  - 4 levels (+++, ++, +, -, or no evaluation) or
  - QSC (percentage)

### 10.3.4 Storage locations

The Multi 3510 IDS meter has two measurement data storages. The measured values recorded either manually or automatic are stored separately in individual measurement data storages.

<table>
<thead>
<tr>
<th>Data storage</th>
<th>Maximum number of datasets</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Manual data storage</strong></td>
<td>500</td>
</tr>
<tr>
<td><strong>Automatic data storage</strong></td>
<td>4500</td>
</tr>
</tbody>
</table>
11 Transferring data (USB interfaces)

11.1 Outputting current measurement data

1. Output the current measurement data to the USB-B interface with 
   \[F2\] [USB output].

11.2 Transferring data (to a PC)

The meter has a USB-B interface (USB Device) e.g. to connect a PC.
Via the USB-B interface (USB Device) you can transmit data to a PC or printer and update the meter software.

11.3 Connecting the PC / USB-B interface (USB Device)

Connect the Multi 3510 IDS to the PC via the USB-B interface.
System requirements of the PC for installation of the USB driver:

- PC with at least one free USB connection and CD-ROM drive

1. Insert the supplied installation CD in the CD drive of your PC.
2. Install the driver from the CD.
   Follow the Windows installation instructions as necessary.
3. Connect the Multi 3510 IDS to the PC via the USB-B interface.
   The meter is listed as a virtual COM interface among the connections in the Windows instrument manager.
4. Set the same transmission data at the connected instrument (PC):
   - Baud rate: to be selected in the range 1200 ... 19200
   - Handshake: RTS/CTS
   - Set at the PC only:
     - Parity: none
     - Data bits: 8
     - Stop bits: 2
11.4 Options for data transmission to a PC

Via the USB-B interface you can transmit data to a PC. The following table shows which data are transmitted to the interface in which way:

<table>
<thead>
<tr>
<th>Data</th>
<th>Control</th>
<th>Operation / description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current measured values of all connected sensors</td>
<td>manual</td>
<td>• With &lt;F2&gt;/[USB output].</td>
</tr>
<tr>
<td></td>
<td>automatic, at intervals</td>
<td>• Simultaneously with every manual storage process (see section 10.1 MANUAL DATA STORAGE, page 73).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Simultaneously with every automatic storage process (see section 10.2 AUTOMATIC DATA STORAGE AT INTERVALS, page 74).</td>
</tr>
<tr>
<td>Stored measured values</td>
<td>manual</td>
<td>• Displayed dataset with &lt;F2&gt;/[USB output] after calling up from the data storage.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• All datasets with the Output to RS232/USB function. (see section 10.3.1 EDITING THE MEASURED VALUE DATA STORAGE, page 76).</td>
</tr>
<tr>
<td>Calibration records</td>
<td>manual</td>
<td>• Calibration record with &lt;F2&gt;/[USB output] (see section 5.2.6 CALIBRATION DATA, page 35; section 7.3.6 CALIBRATION DATA, page 51; section 8.3.4 CALIBRATION DATA, page 58).</td>
</tr>
<tr>
<td></td>
<td>automatic</td>
<td>• At the end of a calibration procedure.</td>
</tr>
</tbody>
</table>

The following rule applies: With the exception of the menus, shortly pressing the <F2>/[USB output] key generally outputs the display contents to the interface (displayed measured values, measuring datasets, calibration records).

11.5 MultiLab Importer

With the aid of the MultiLab Importer software, you can record and evaluate measuring data with a PC.

More detailed information can be found in the MultiLab Importer operating manual.

With the aid of the BOD Analyst Pro software you can administrate BOD measurement on the PC and automatically calculate the measured values.
12 Maintenance, cleaning, disposal

12.1 Maintenance

12.1.1 General maintenance activities

The only maintenance activity required is replacing the batteries.

See the relevant operating manuals of the IDS sensors for instructions on maintenance.

12.1.2 Replacing the batteries

You can operate the meter either with normal batteries or with rechargeable batteries (Ni-MH). In order to charge the batteries, an external charging device is required.

1. Unscrew the two screws (1) on the underside of the meter.
2. Open the battery compartment (2) on the underside of the meter.
3. Remove the batteries from the battery compartment.

CAUTION
Make sure that the poles of the batteries are positioned correctly. The ± signs on the batteries must correspond to the ± signs in the battery compartment.
You can operate the meter either with normal batteries or with rechargeable batteries (Ni-MH). In order to charge the batteries, an external charging device is required.

4. Place four batteries (type Mignon AA) in the battery compartment.
5. Close the battery compartment (2).
6. Set the date and time (see section 4.5.5 EXAMPLE 2 ON NAVIGATION: SETTING THE DATE AND TIME, page 24).

Dispose of used batteries according to the local regulations of your country.
End users within the European Union are obligated to return used batteries (even ecologically compatible ones) to a collection point set up for recycling purposes.

Batteries are marked with the crossed-out waste container symbol. Therefore, they may not be disposed with the domestic waste.

12.2 Cleaning

Occasionally wipe the outside of the measuring instrument with a damp, lint-free cloth. Disinfect the housing with isopropanol as required.

CAUTION
The housing is made of synthetic material (ABS). Thus, avoid contact with acetone or similar detergents that contain solvents. Remove any splashes immediately.

12.3 Packing

This meter is sent out in a protective transport packing. We recommend: Keep the packing material. The original packing protects the meter against damage during transport.

12.4 Disposal

At the end of its operational lifetime, the meter must be returned to the disposal or return system statutory in your country. If you have any questions, please contact your supplier.
## 13 What to do if...

### 13.1 pH

More information and instructions on cleaning and exchange of sensors are given in the documentation of your sensor.

**FCC Class A Equipment Statement**

*Note:* This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense. Changes or modifications not expressly approved by the manufacturer could void the user’s authority to operate the equipment.
15 Firmware update

15.1 Firmware update for the meter Multi 3510 IDS

You can find available firmware update files for your meter on the Internet. With the "Firmware Update" program and a PC you can update the firmware of the Multi 3510 IDS to the newest version.

For the update you have to connect the meter to a PC.

For the update via the USB-B interface, the following is required:

- a free USB interface (virtual COM port) on the PC
- the driver for the USB interface (on the enclosed CD-ROM)
- the USB cable (included in the scope of delivery of the Multi 3510 IDS).

1. Install the downloaded firmware update on a PC.
   An update folder is created in the Windows start menu.
   If an update folder already exists for the meter (or meter type), the new data are displayed there.
2. In the windows start menu, open the update folder and start the firmware update program for the meter
3. Using the USB interface cable, connect the Multi 3510 IDS to a USB interface (virtual COM port) of the PC.
4. Switch on the Multi 3510 IDS.
5. In the firmware update program, start the update process with OK.
6. Follow the instructions of the firmware update program.
   During the programming process, a corresponding message and a progress bar (in %) are displayed.
   The programming process takes up to 15 minutes. A terminatory message is displayed after a successful programming process. The firmware update is completed.
7. Disconnect the Multi 3510 IDS from the PC.
   The Multi 3510 IDS is ready for operation again.

After switching the meter off and on you can check whether the meter has taken over the new software version (see YOU WANT TO KNOW WHICH SOFTWARE VERSION IS IN THE METER OR IDS SENSOR, PAGE 86).
15.2 Firmware-Update for IDS Sensors

With the "Firmware Update" program and a PC you can update the firmware of an IDS sensor to the newest version.

You can find available firmware update files for your IDS sensor on the Internet.

For updating, connect the IDS sensor to the Multi 3510 IDS, and the Multi 3510 IDS to a PC.

For the update via the USB-B interface, the following is required:
- a free USB interface (virtual COM port) on the PC
- the driver for the USB interface (on the enclosed CD-ROM)
- the USB cable (included in the scope of delivery of the Multi 3510 IDS).

1. Install the downloaded firmware update on a PC.
   An update folder is created in the Windows start menu.
   If an update folder already exists for the sensor (or sensor type), the new data are displayed there.

2. In the windows start menu, open the update folder and start the firmware update program for the IDS sensor.

3. Connect the IDS sensor to the Multi 3510 IDS meter.

4. Using the USB interface cable, connect the Multi 3510 IDS to a USB interface (virtual COM port) of the PC.

5. Switch on the Multi 3510 IDS.

6. In the firmware update program, start the update process with OK.

7. Follow the instructions of the firmware update program.
   During the programming process, a corresponding message and a progress bar (in %) are displayed.
   The programming process takes up to 5 minutes. A terminatory message is displayed after a successful programming process. The firmware update is completed.

8. Disconnect the Multi 3510 IDS from the PC.
   Meter and sensor are ready for operation again.

After switching the meter off and on you can check whether the sensor has taken over the new software version (see YOU WANT TO KNOW WHICH SOFTWARE VERSION IS IN THE METER OR IDS SENSOR, PAGE 86).
16 Glossary

pH/ORP

Asymmetry  see zero point

Electromotive force of an electrode  The electromotive force $U$ of the combination electrode is the measurable electromotive force of an electrode in a solution. It equals the sum of all the galvanic voltages of the combination electrode. Its dependency on the pH results in the electrode function, which is characterized by the parameters, slope and zero point.

Junction  The junction is a porous body in the housing wall of reference electrodes or electrolyte bridges. It arranges the electrical contact between two solutions and makes the electrolyte exchange more difficult. The expression, junction, is also used for ground or junctionless transitions.

ORP voltage (U)  The ORP is caused by oxidizing or reducing substances dissolved in water if these substances become effective on an electrode surface (e.g. a gold or platinum surface).

pH value  The pH value is a measure of the acidic or basic effect of an aqueous solution. It corresponds to the negative decadic logarithm of the molal hydrogen ions activity divided by the unit of the molality. The practical pH value is the value of a pH measurement.

Potentiometry  Name of a measuring technique. The signal (depending on the measured parameter) of the electrode is the electrical potential. The electrical current remains constant.

Slope  The slope of a linear calibration function.

Zero point  The zero point of a pH combination electrode is the pH value at which the electromotive force of the pH combination electrode at a specified temperature is zero. Normally, this is at 25 °C.

Conductivity

Cell constant, $C$  Characteristic quantity of a conductivity measuring cell, depending on the geometry.

Conductivity, $\kappa$  Short form of the expression, specific electrical conductivity. It corresponds to the reciprocal value of the resistivity. It is a measured value of the ability of a substance to conduct an electric current. In water analysis, the electrical conductivity is a dimension for the ionized substances in a solution.

Reference temperature  Fixed temperature value to compare temperature-dependent measured values. For conductivity measurements, the measured value is converted to a conductivity value at a reference temperature of 20 °C or 25 °C.

Resistivity, $\rho$  Short name for the electrolytic resistivity. It corresponds to the reciprocal value of the electrical conductivity.
### Salinity
The absolute salinity $S_A$ of seawater corresponds to the relationship of the mass of dissolved salts to the mass of the solution (in g/kg). In practice, this dimension cannot be measured directly. Therefore, the practical salinity according to IOT is used for oceanographic monitoring. It is determined by measuring the electrical conductivity.

### Salt content
General designation for the quantity of salt dissolved in water.

### Temperature coefficient
Value of the slope $\alpha$ of a linear temperature function.

\[
\alpha_{T_{\text{Ref}}} = \frac{1}{\frac{1}{\alpha_{\text{Meas}}} + \frac{T - T_{\text{Ref}}}{c_97}}
\]

### Temperature compensation
Name of a function that considers the temperature influence on the measurement and converts it accordingly. Depending on the measured parameter to be determined, the temperature compensation functions in different ways. For conductimetric measurements, the measured value is converted to a defined reference temperature. For potentiometric measurements, the slope value is adjusted to the temperature of the test sample but the measured value is not converted.

### Dissolved oxygen

<table>
<thead>
<tr>
<th>D.O. partial pressure</th>
<th>Pressure caused by the oxygen in a gas mixture or liquid.</th>
</tr>
</thead>
<tbody>
<tr>
<td>D.O. % saturation</td>
<td>Short name for the &quot;relative D.O. saturation&quot;.</td>
</tr>
</tbody>
</table>

Relation of the D.O. partial pressure in the test sample to the D.O. partial pressure of air at the current air pressure.

Example: 100% means that the test sample and the ambient air have the same D.O. partial pressure – air and test sample are balanced.

### OxiCal®
WTW name for a procedure to calibrate D.O. measuring systems in water vapor saturated air.

### Salinity
The absolute salinity $S_A$ of seawater corresponds to the relationship of the mass of dissolved salts to the mass of the solution (in g/kg). In practice, this dimension cannot be measured directly. Therefore, the practical salinity according to IOT is used for oceanographic monitoring. It is determined by measuring the electrical conductivity.

### Salt content
General designation for the quantity of salt dissolved in water.

### Slope (relative)
Designation used by WTW in the D.O. measuring technique. It expresses the relation of the slope value to the value of a theoretical reference sensor of the same construction type.
General information

Adjusting
To manipulate a measuring system so that the relevant value (e.g. the displayed value) differs as little as possible from the correct value or a value that is regarded as correct, or that the difference remains within the tolerance.

AutoRange
Name of the automatic selection of the measuring range.

Calibration
Comparing the value from a measuring system (e.g. the displayed value) to the correct value or a value that is regarded as correct. Often, this expression is also used when the measuring system is adjusted at the same time (see adjusting).

Measured parameter
The measured parameter is the physical dimension determined by measuring, e.g. pH, conductivity or D.O. concentration.

Measured value
The measured value is the special value of a measured parameter to be determined. It is given as a combination of the numerical value and unit (e.g. 3 m; 0.5 s; 5.2 A; 373.15 K).

Molality
Molality is the quantity (in Mol) of a dissolved substance in 1000 g solvent.

Reset
Restoring the original condition of all settings of a measuring system.

Resolution
Smallest difference between two measured values that can be displayed by a meter.

Stability control
Function to control the measured value stability.

AutoRead

Standard solution
The standard solution is a solution where the measured value is known. It is used to calibrate a measuring system.

Temperature function
Name of a mathematical function expressing the temperature behavior of a test sample, a sensor or part of a sensor.

Test sample
Designation of the test sample ready to be measured. Normally, a test sample is made by processing the original sample. The test sample and original sample are identical if the test sample was not processed.

Xylem |ˈzɪəm|

1) The tissue in plants that brings water upward from the roots; 
2) a leading global water technology company.

We’re 12,500 people unified in a common purpose: creating innovative solutions to meet our world’s water needs. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. We move, treat, analyze, and return water to the environment, and we help people use water efficiently, in their homes, buildings, factories and farms. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise, backed by a legacy of innovation.

For more information on how Xylem can help you, go to www.xyleminc.com
